- Key Revenue Insights
- Visualization Tips

1

Introduction

Explore the **techniques** and **concepts** needed to create high-quality **financial reports** in **Power BI**. Whether you're dealing with income statements, balance sheets, or cash flow statements, the strategies provided will enable you to **deliver scalable** and **professional results**.

- Learn to create **dynamic income statements**, **balance sheets**, and **cash flow statements** tailored to various business needs.
- Develop techniques for **accounts receivable analysis**, enabling you to manage outstanding **invoices** efficiently.
- Gain insights into **revenue** and **sales trends** by integrating advanced **DAX formulas** and dynamic **visualizations**.

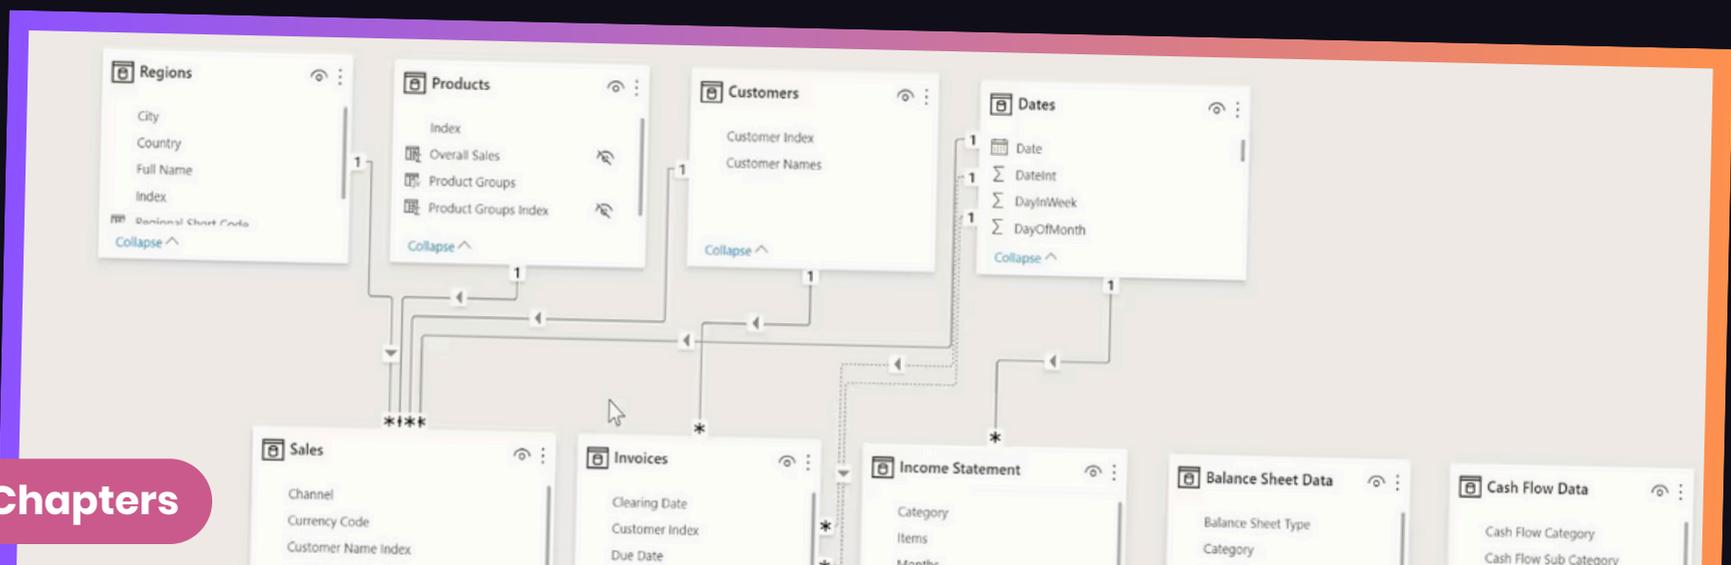

2

Planning Your Data Model

Creating a well-structured **data model** is essential for any successful **Power BI project**, especially when dealing with **financial reporting**. A clear and efficient **data model** ensures that your **reports** are **scalable**, dynamic, and capable of handling complex calculations. Discover the foundational steps of planning and building a Power BI data model that integrates multiple **data sources** and accommodates unique **financial reporting** needs.

- Learn to **differentiate** between **fact tables**, **lookup tables**, and **supporting tables** to build a clear data model.
- Understand how **data flows** through a model, using **lookup tables** to **filter calculations** within fact tables.

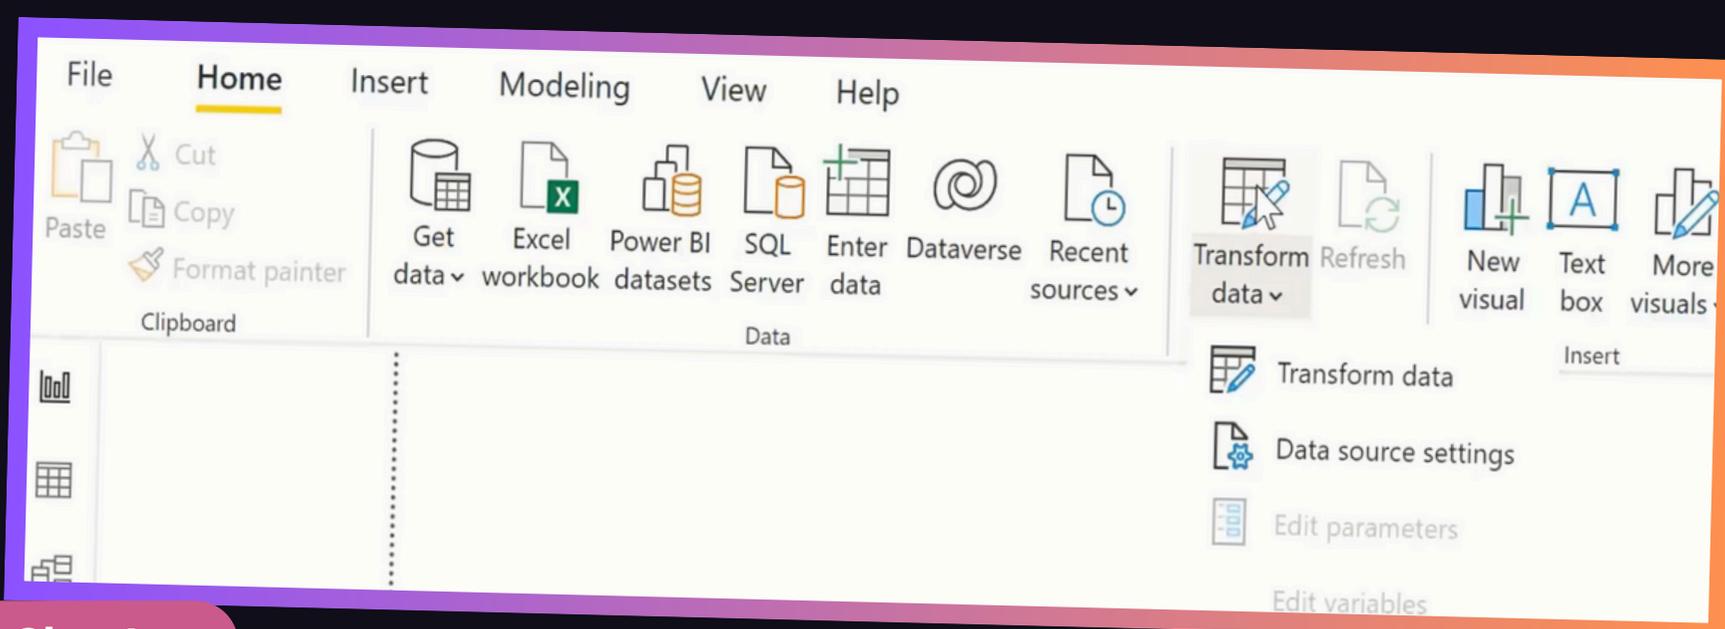

- Discover how to create **templates** for **financial reports** like income statements, balance sheets, and cash flow statements.
- Incorporate essential **elements** like a **date table** to facilitate **time-based analysis** and **comparisons**.

Planning your **data model** is a critical step in creating a successful **Power BI report**. By understanding the **distinction** between fact tables, lookup tables, and supporting tables, you can build a **scalable** and **efficient data structure** that handles complex financial reporting needs.

	A	B	C	D	E	F
	Balance Sheet Type	Category	Sub Category	2014	2015	2016
1	Assets	Current Assets	Cash	11,874	11,875	11,876
2	Assets	Current Assets	Accounts receivable	4,215	4,216	4,217
3	Assets	Current Assets	Inventory	2,145	2,146	2,147
4	Assets	Current Assets	Prepaid expenses	354	355	356
5	Assets	Current Assets	Short-term investments	254	255	256
6	Assets	Fixed (Long-Term) Assets	Long-term investments	1,208	1,209	1,210
7	Assets	Fixed (Long-Term) Assets	Property, plant, and equipment	15,340	15,341	15,342
8	Assets	Fixed (Long-Term) Assets	(Less accumulated depreciation)	-2,200	-2,199	-2,198
9	Assets	Fixed (Long-Term) Assets	Intangible assets	2,215	2,216	2,217
0	Assets	Other Assets	Deferred income tax	134	135	136
1	Assets	Other Assets	Other	324	325	326
2	Liabilities	Current Liabilities	Accounts payable	8,060	8,061	8,062
3	Liabilities	Current Liabilities	Short-term loans	200	201	202
4	Liabilities	Current Liabilities	Income taxes payable	3,145	3,146	3,147
5	Liabilities	Current Liabilities	Accrued salaries and wages	50	51	52
6	Liabilities	Current Liabilities	Unearned revenue	333	334	335
7	Liabilities	Current Liabilities	Current portion of long-term debt	0	1	2
8	Liabilities	Long-Term Liabilities	Long-term debt	3,450	3,451	3,452
9	Liabilities	Long-Term Liabilities	Deferred income tax	252	253	254
0	Liabilities	Long-Term Liabilities	Other	111	112	113
1	Owner's Equity	Owner's Equity	Owner's investment	7,178	7,179	7,180
2	Owner's Equity	Owner's Equity	Retained earnings	4,389	4,390	4,391
3	Owner's Equity	Owner's Equity	Other	0	1	2

One of the **most critical** steps in any Power BI project is **bringing your data** into the **model**. Properly importing and preparing your data lays the foundation for **successful reporting** and **analysis**. Discover the process of **loading data** into Power BI, focusing on best practices such as using the **Query Editor**, organizing your tables, and setting up essential components like a date table.

- **Power BI** supports **data imports** from various sources, including Excel, ERP systems, and Azure databases. Regardless of your source, it's essential to ensure that the data is **properly cleaned** and **organized** before you start building your model.
- Always start by **loading your data** through the **Query Editor**. This allows you to handle multiple datasets simultaneously and perform necessary transformations before the data reaches your model.

PRO TIPS

- Aim for **clarity** and **simplicity** and **avoid overcomplicating** your data model, as complex models can lead to calculation errors and confusion for users.
- Place **lookup tables** at the **top** and **fact tables** at the **bottom** of your data model and filters should flow from lookup tables to fact tables to ensure seamless calculations across the entire report.
- **Organize** your **model** with **lookup tables** at the top and fact tables at the bottom.
- During development, use **helper columns** to **debug your model**, but remove them once your model is finalized to improve performance.
- If your data is already in a pivoted format, **avoid forcing** it into a **table structure** that could cause errors. Instead, maintain a row-based structure where possible.
- Don't wait until later to organize your tables. **Do it as soon as you import** them to avoid confusion.

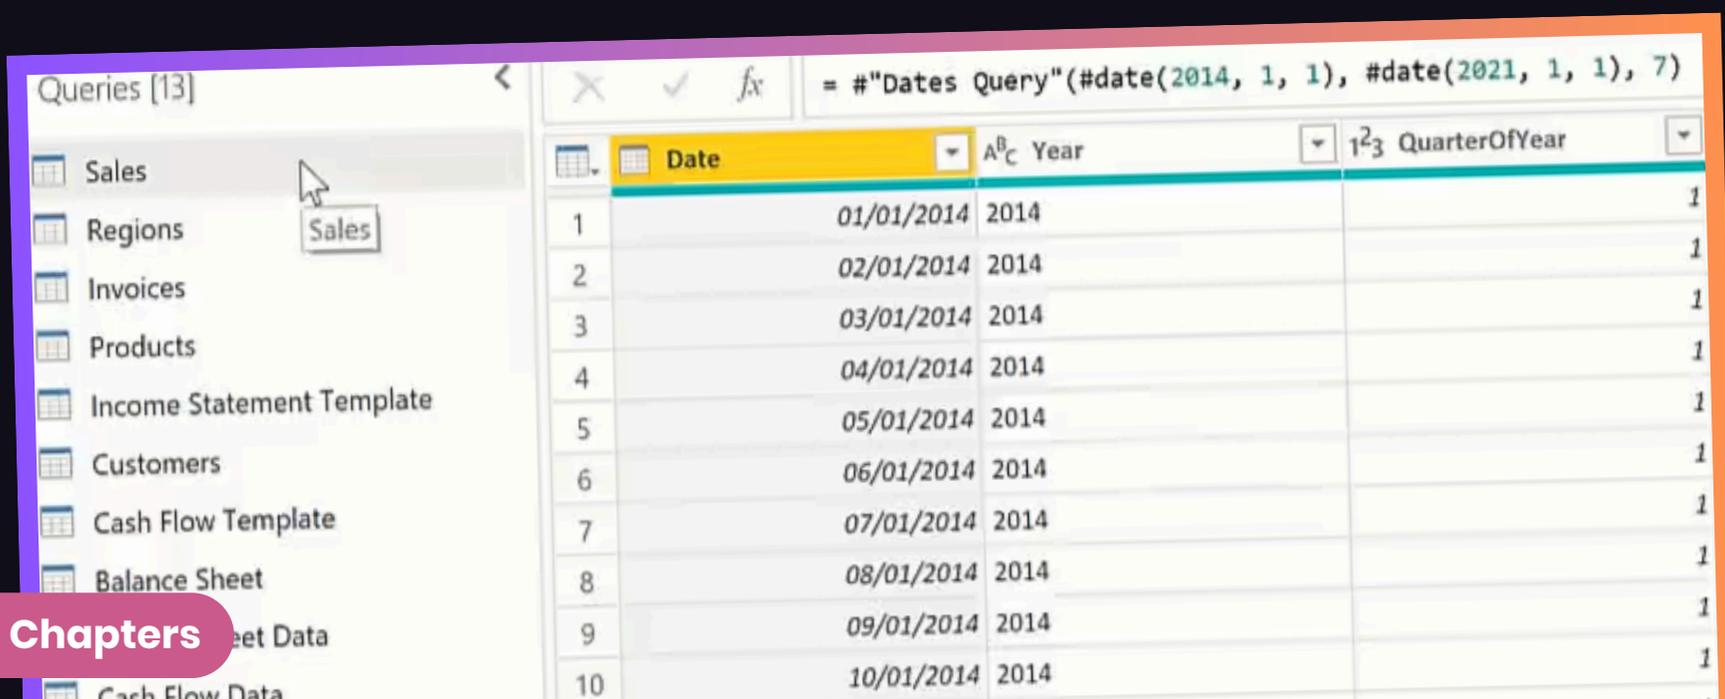

3

Query Editor

Once you've brought your data into Power BI, the next crucial step is to **clean** and **transform** it within the **Query Editor**. Skipping this stage often leads to messy models, difficult **DAX calculations**, and confusion for future users of your report. The **Query Editor** offers a powerful **set of tools** to ensure that your data is **well-structured**, easy to understand, and optimized for modeling.

Explore the practical techniques for **renaming** tables and columns, **grouping** queries, **removing** unnecessary columns, and **performing** common **transformations**.

- Rename tables and columns for clarity and consistency. Use simple, **intuitive names** that make writing **DAX formulas** faster and more efficient.

The screenshot shows the Power BI Query Editor interface. On the left, there is a list of queries including Sales, Regions, Invoices, Products, Income Statement Template, Customers, Cash Flow Template, Balance Sheet, and Cash Flow Data. The 'Sales' query is selected. The main area displays a table with the following columns: Date, Year, and QuarterOfYear. The table contains 10 rows of data, starting from 01/01/2014 and ending at 10/01/2014, all for the year 2014. The formula bar at the top shows the query definition: = #\"Dates Query\"(#date(2014, 1, 1), #date(2021, 1, 1), 7).

	Date	Year	QuarterOfYear
1	01/01/2014	2014	1
2	02/01/2014	2014	1
3	03/01/2014	2014	1
4	04/01/2014	2014	1
5	05/01/2014	2014	1
6	06/01/2014	2014	1
7	07/01/2014	2014	1
8	08/01/2014	2014	1
9	09/01/2014	2014	1
10	10/01/2014	2014	1

- Learn to **group related queries** into **folders** to keep your workspace clean and easy to **navigate** and **eliminate** any **columns** that aren't needed in your analysis to improve model performance and reduce clutter.
- Ensure that **columns** have the **correct data types** (e.g., dates, numbers, text) to avoid calculation errors down the line.

These cleanups might seem minor, but they have a **significant impact** on your **workflow**. The time you invest here will save you time and effort later when building your model and writing calculations. With your **data clean** and **organized**, you're now ready to move on to structuring your data for financial reporting.

Sub Category	2014	2015	2016	2017
Cash	11874	11875.15	11876.3	11877.45
Accounts receivable	4215	4216.15	4217.3	4218.45
Inventory	2145	2146.15	2147.3	2148.45
Prepaid expenses	354	355.15	356.3	357.45
Short-term investments	254	255.15	256.3	257.45
Long-term investments	1208	1209.15	1210.3	1211.45
Property, plant, and equipment	15340	15341.15	15342.3	15343.45
(Less accumulated depreciation)	-2200	-2198.85	-2197.7	-2196.55
Intangible assets	2215	2216.15	2217.3	2218.45
Deferred income tax	134	135.15	136.3	137.45
Other	324	325.15	326.3	327.45
Accounts payable	8060	8061.15	8062.3	8063.45
Short-term loans	200	201.15	202.3	203.45
Income taxes payable	3145	3146.15	3147.3	3148.45
Accrued salaries and wages	50	51.15	52.3	53.45
Unearned revenue	333	334.15	335.3	336.45
Current portion of long-term debt	0	1.15	2.3	3.45
Long-term debt	3450	3451.15	3452.3	3453.45
Deferred income tax	252	253.15	254.3	255.45
Investment	111	112.15	113.3	114.45
	7178	7179.15	7180.3	7181.45

PRO TIPS

- Use clear, **intuitive names** for **tables** and **columns** to speed up **DAX formula** writing and improve readability.
- Group your **queries** for **better organization**. Use **folders** like Data Model, Templates, and Measure Groups.
- Keep your **model lean** by **removing columns** you don't need. This reduces file size and improves performance.
- Perform **similar cleanup actions** in one step to keep your applied steps efficient.
- When performing transformations like renaming columns or removing columns, try to **batch similar steps** together. Power BI's **Query Editor** records each transformation as a step in the Applied Steps pane.
- Use **Column from Examples feature** to quickly create new columns based on patterns without writing complex formulas.

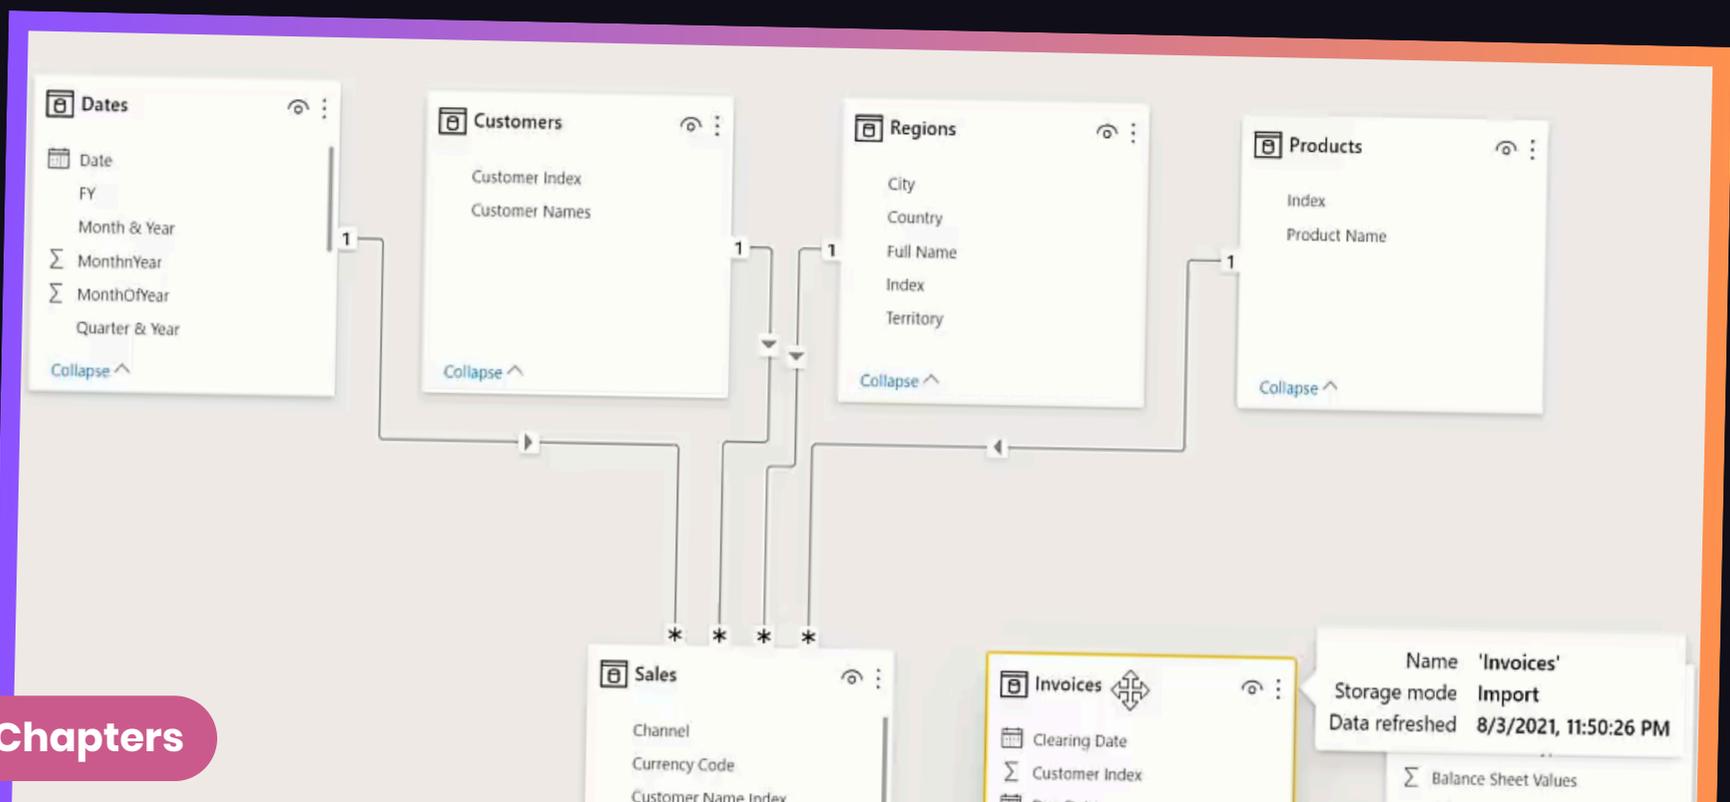

4

Data Model Development

Developing your data model involves organizing tables, creating the right relationships, and ensuring that filters flow correctly through your model.

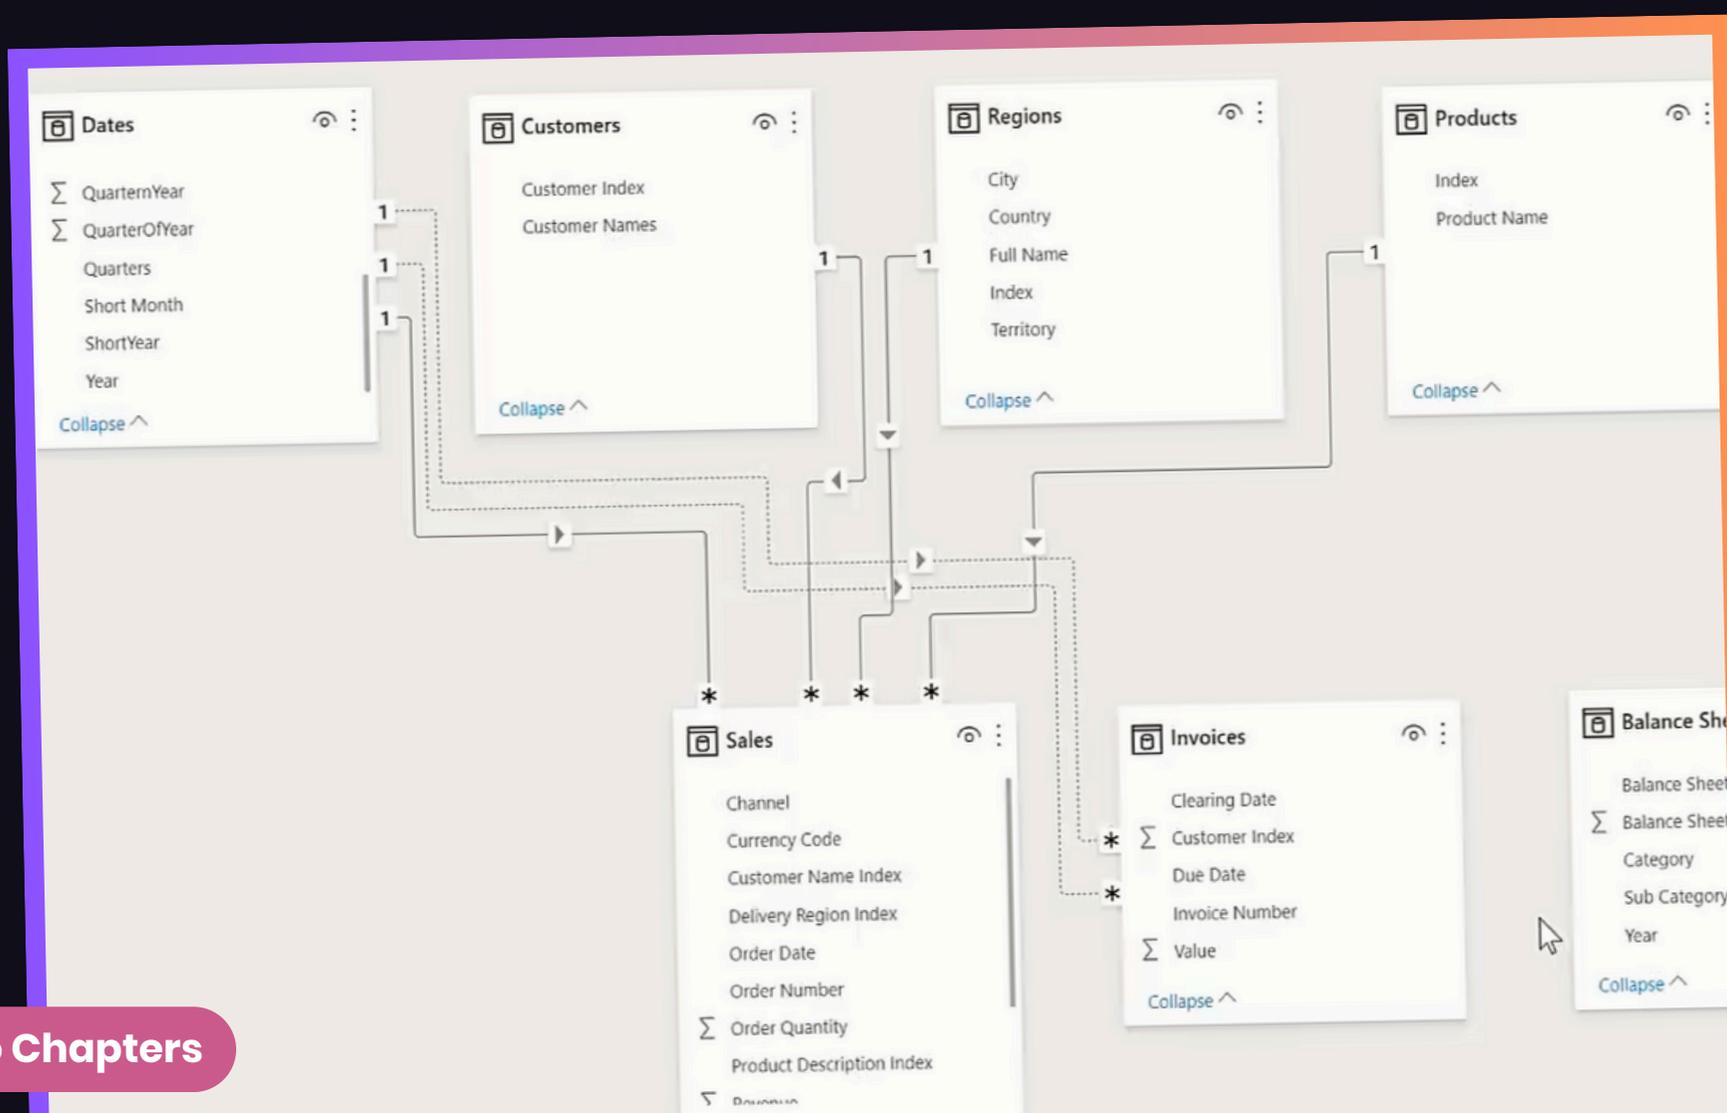

The way you structure your data model directly impacts the performance, accuracy, and usability of your reports. Discover the best practices for organizing tables, building optimal relationships, and managing complex scenarios like multiple dates and virtual relationships.

- Understand how to organize tables into lookup and fact tables to create a model that's easy to navigate and maintain.

- Learn how to manually build **one-to-many relationships** to ensure **filters flow correctly** through your model, avoiding common pitfalls like bidirectional and many-to-many relationships.
- Discover how to handle **multiple date columns** using **inactive relationships** and activate them dynamically with **DAX** for more flexible time-based analysis.

Managing complex scenarios, such as **multiple dates** and **virtual relationships**, further enhances your model's flexibility and performance. With a solid data model in place, you're now ready to **integrate financial data** from **multiple sources** and start building impactful financial reports.

PRO TIPS

- Financial data often includes a **Year column** that needs to **link** to a **date table**. However, directly linking the Year column from financial data to the Year column in the date table can result in a many-to-many relationship, which should be avoided.
- It's common to encounter **fact tables** with **multiple date columns** (e.g., order date, due date, clearing date). Power BI only allows **one active relationship** between tables, so you need to manage additional dates using inactive relationships.
- While Power BI allows **many-to-many relationships** and **bidirectional filtering**, these should be avoided whenever possible. They can cause unexpected filtering behavior and make your model difficult to manage.
- Use inactive relationships and the **USERELATIONSHIP** function in **DAX** to manage multiple dates in fact tables.

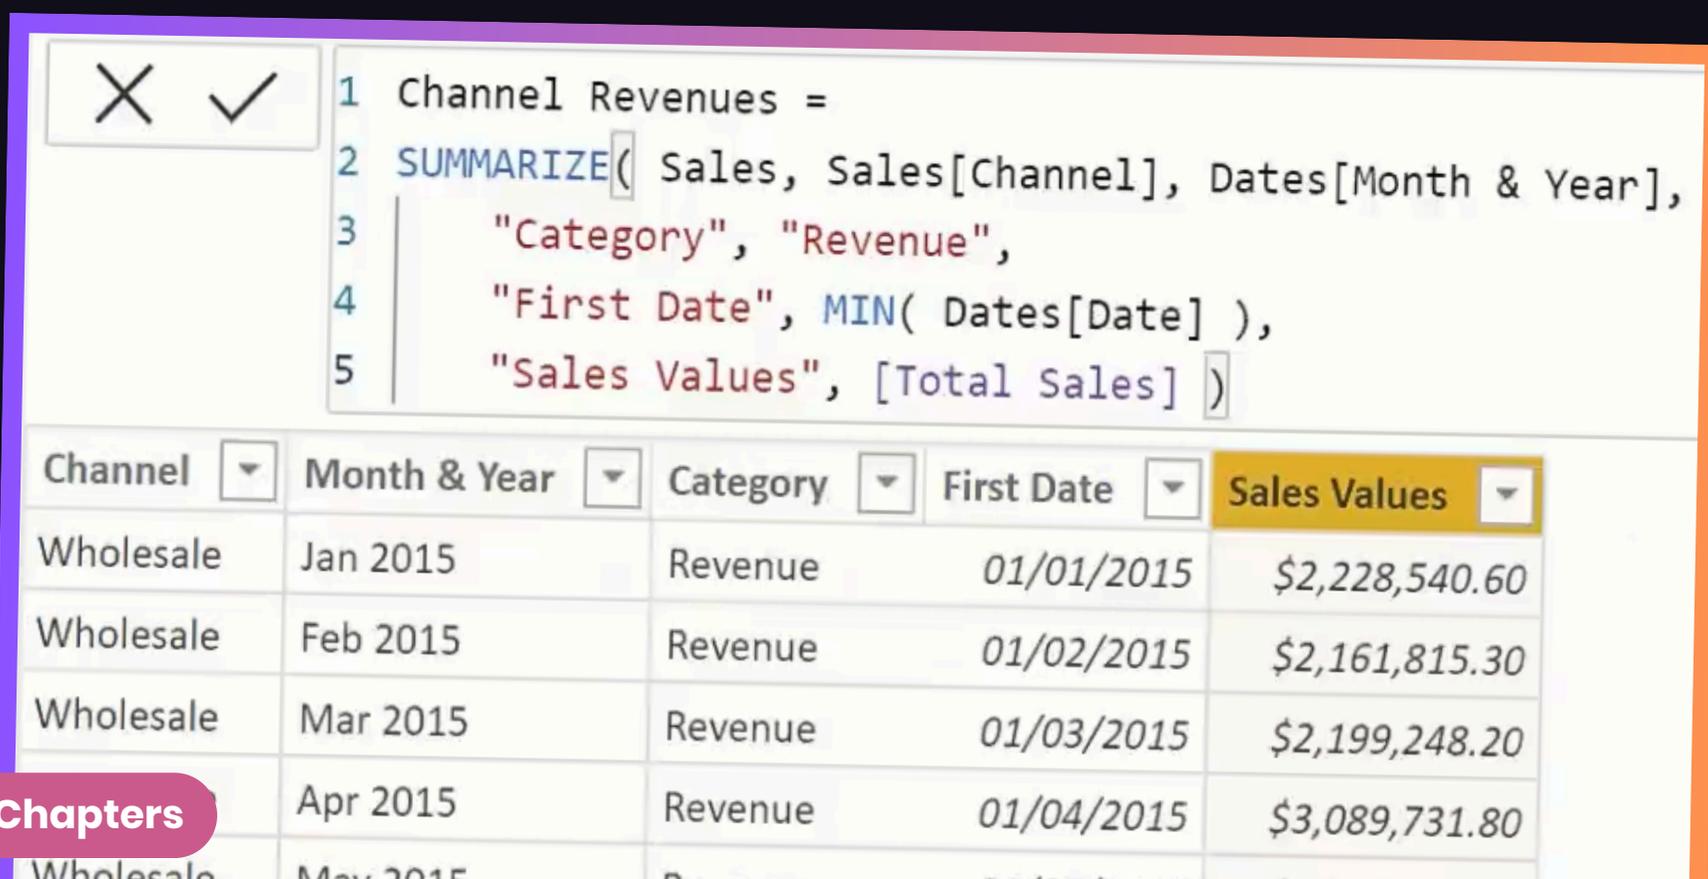

5

Table Integration

Financial reports often require data from multiple sources, each with varying levels of granularity. To build an accurate and dynamic income statement in Power BI, it's essential to integrate these data sources into a single table that can be used in your financial templates.

Learn how to create new tables using DAX, summarize data to match different levels of detail, and append tables using functions like UNION.

- Learn how to generate new tables directly in Power BI using SUMMARIZE to aggregate and structure data at the appropriate level for your reports.

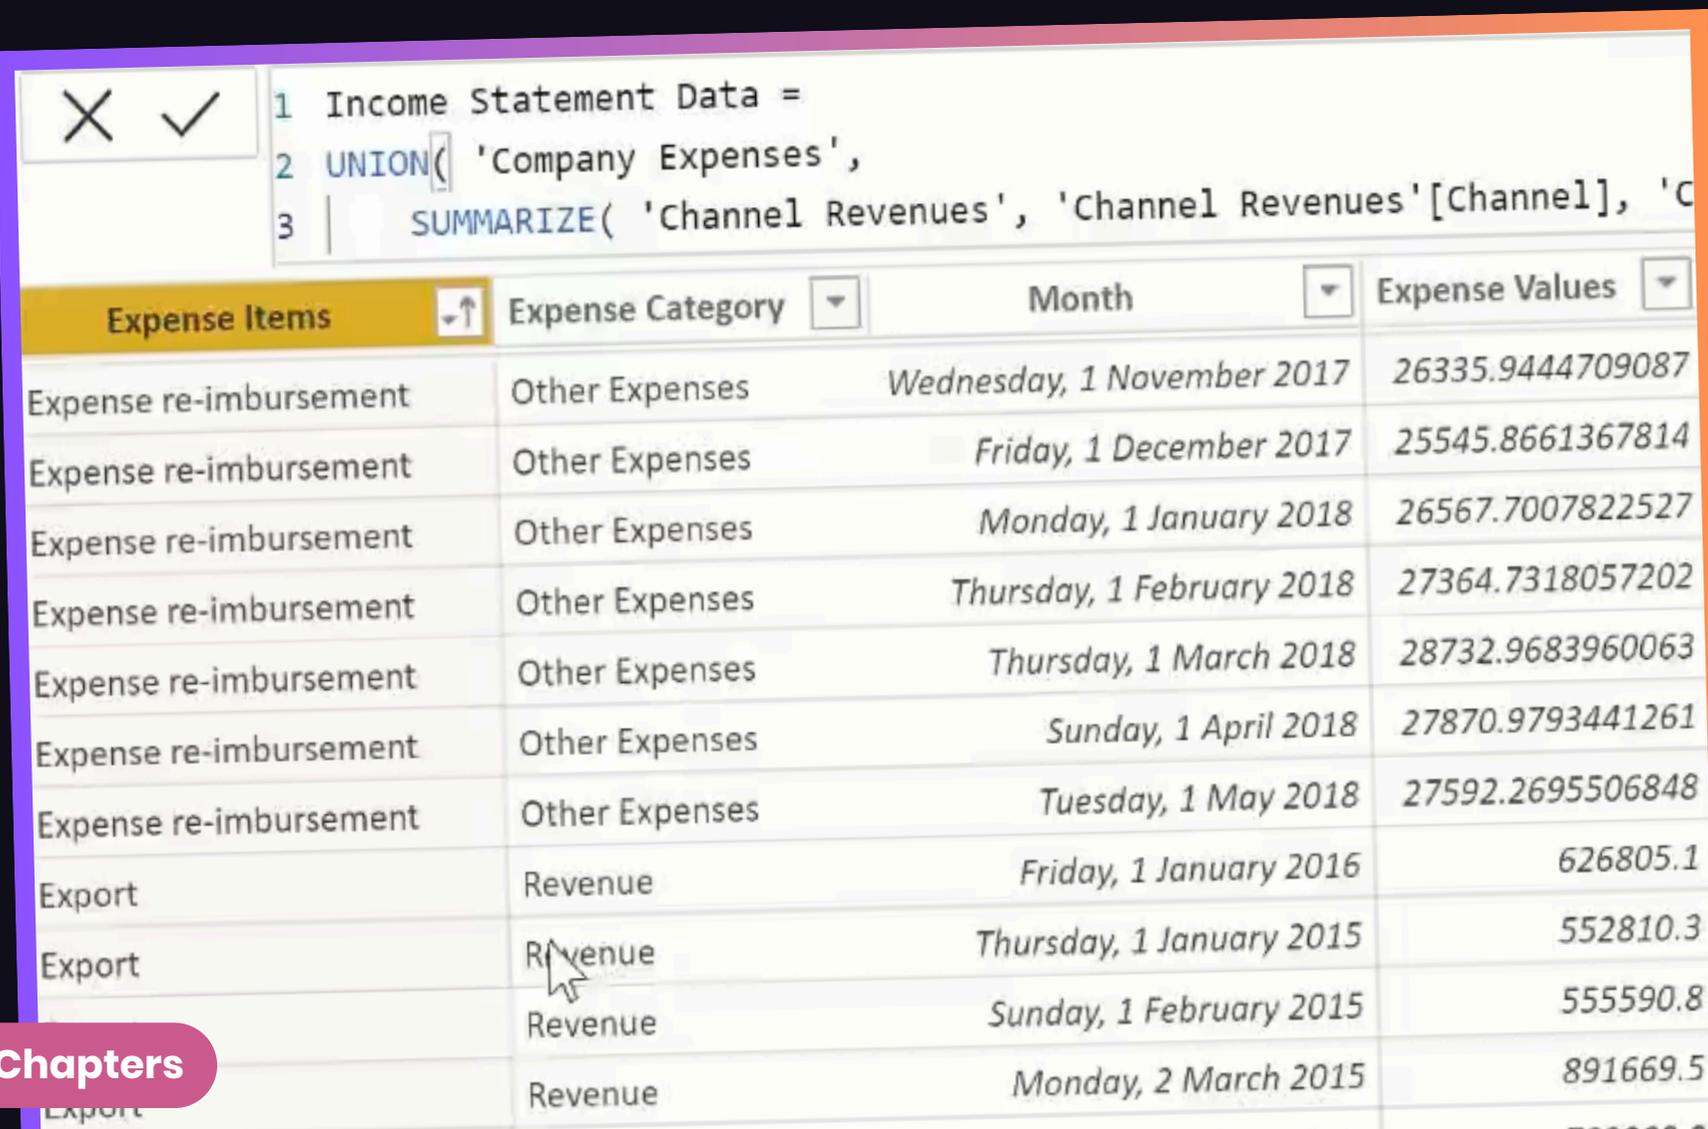

The screenshot shows a DAX formula in the Power BI formula bar and a corresponding data table. The formula is used to create a new table named 'Channel Revenues' by summarizing data from the 'Sales' table. The formula uses the SUMMARIZE function to aggregate data by channel, month, and year, and to calculate the total revenue for each category.

```
1 Channel Revenues =  
2 SUMMARIZE( Sales, Sales[Channel], Dates[Month & Year],  
3     "Category", "Revenue",  
4     "First Date", MIN( Dates[Date] ),  
5     "Sales Values", [Total Sales] )
```

Channel	Month & Year	Category	First Date	Sales Values
Wholesale	Jan 2015	Revenue	01/01/2015	\$2,228,540.60
Wholesale	Feb 2015	Revenue	01/02/2015	\$2,161,815.30
Wholesale	Mar 2015	Revenue	01/03/2015	\$2,199,248.20
Wholesale	Apr 2015	Revenue	01/04/2015	\$3,089,731.80
Wholesale	May 2015	Revenue	01/05/2015	\$2,199,248.20

- Discover how to use the **UNION function** to **combine tables** generated by **DAX**, creating a single table that integrates both revenue and expense data.
- Understand how to **align** different **levels of data granularity**, such as daily sales data and monthly expenses, to create a consistent and comparable dataset.

With a **clean** and **optimized** Income Statement Data table in place, you'll be able to write efficient **DAX formulas** and generate dynamic financial reports with ease. This step is essential for handling complex **financial data** and delivering **high-quality insights** in your Power BI reports.

```
1 Income Statement Data =
2 UNION( 'Company Expenses',
3 SUMMARIZE( 'Channel Revenues', 'Channel Revenues'[Channel], 'C
```

Expense Items	Expense Category	Month	Expense Values
Expense re-imburement	Other Expenses	Wednesday, 1 November 2017	26335.9444709087
Expense re-imburement	Other Expenses	Friday, 1 December 2017	25545.8661367814
Expense re-imburement	Other Expenses	Monday, 1 January 2018	26567.7007822527
Expense re-imburement	Other Expenses	Thursday, 1 February 2018	27364.7318057202
Expense re-imburement	Other Expenses	Thursday, 1 March 2018	28732.9683960063
Expense re-imburement	Other Expenses	Sunday, 1 April 2018	27870.9793441261
Expense re-imburement	Other Expenses	Tuesday, 1 May 2018	27592.2695506848
Export	Revenue	Friday, 1 January 2016	626805.1
Export	Revenue	Thursday, 1 January 2015	552810.3
Export	Revenue	Sunday, 1 February 2015	555590.8
Export	Revenue	Monday, 2 March 2015	891669.5

PRO TIPS

- Ensure that your **tables** have the **same granularity** before attempting to append them. Use **SUMMARIZE** to create monthly summaries for daily sales data.
- When appending tables created through **DAX**, use the **UNION function** to combine them. This method is essential when dealing with tables that aren't part of the original data source.
- Keep your **model clean** by **hiding tables** that are used solely for supporting calculations. Only keep the main tables visible in the report view.
- Always link your **integrated table** to the **Date Table** to enable time-based filtering and analysis.
- Once the Income Statement Data table is created, you can **optimize** your model by **hiding the supporting tables** (e.g., Channel Revenues and Company Expenses) from the report view.

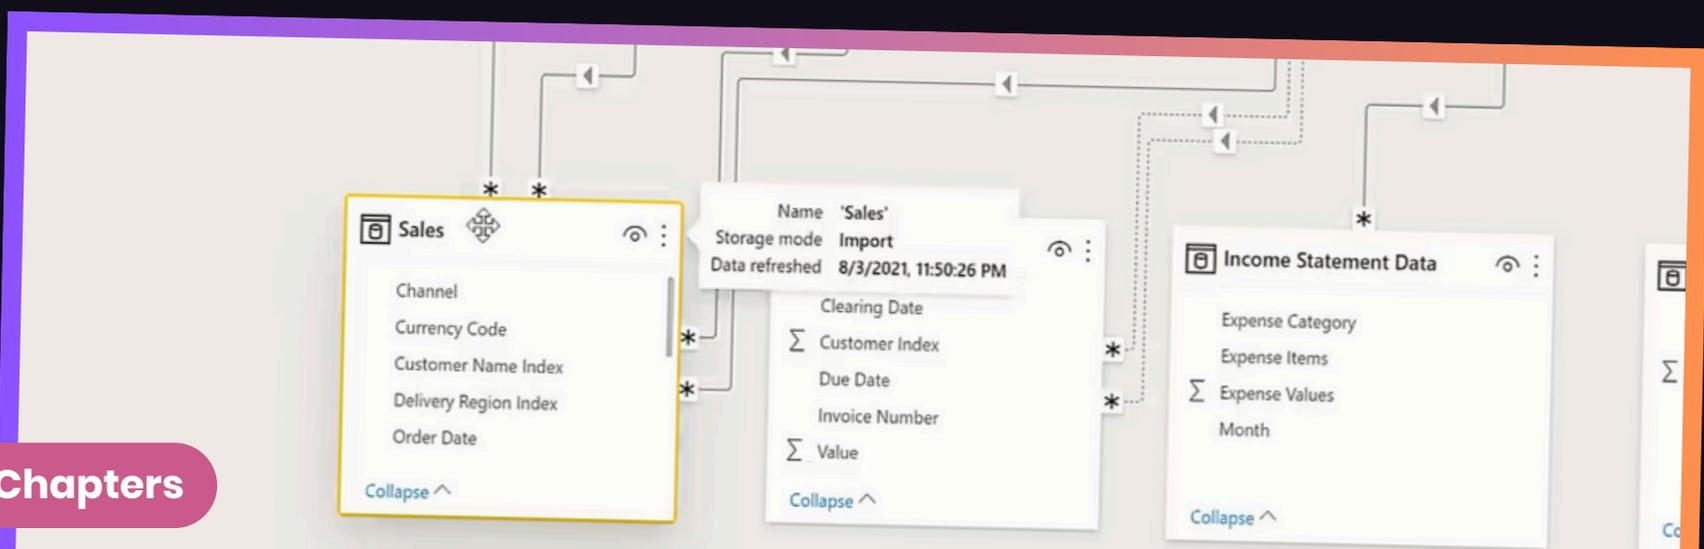

6

Model Organization

A well-organized **Power BI model** isn't just about aesthetics—it's about efficiency, clarity, and scalability. The more tables, measures, and relationships your model contains, the **more essential** it becomes to **structure** everything **logically** from the start.

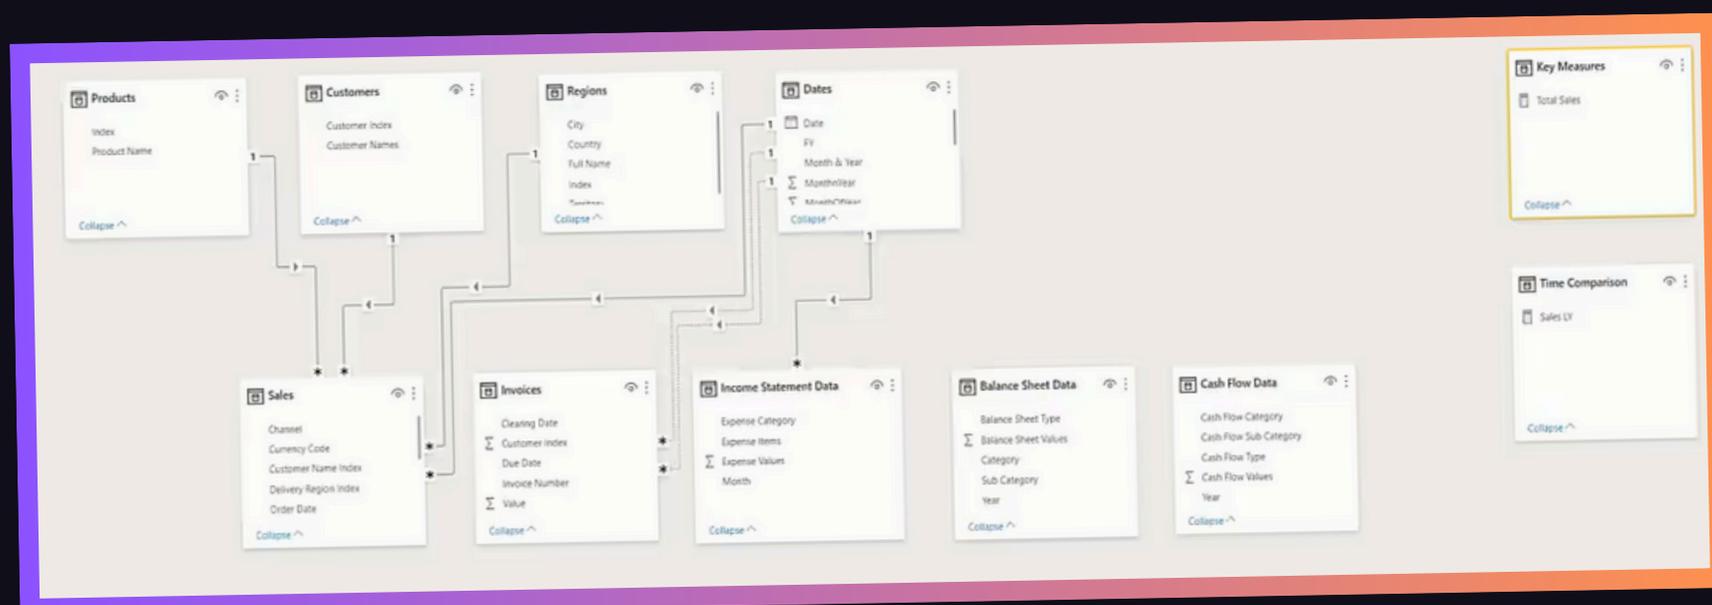

Learn practical strategies to keep your model **clean** and **structured** by arranging tables and relationships, creating measure groups, and managing **visibility** within your model. These steps will save you time and effort in future development, ensuring that your **Power BI model** remains **easy to work** with as it grows.

- Understand why maintaining consistent **table sizes** and **shapes** in your **model view** improves visual clarity and helps manage relationships more effectively.

- Learn how to arrange **lookup tables**, **fact tables**, and **supporting tables** in a structured, logical way to improve readability and navigation within the model view.
- Discover how to create **measure groups** to organize your **calculations** by **category** (e.g., Key Measures, Time Comparisons), reducing clutter and making your model easier to navigate.
- Learn when to **hide supporting tables** and **measure groups** from the **report view** to keep your data model clean and focused on essential tables.

These small organizational **tweaks** will save you significant time and effort as your model grows. With a clean, structured model, you'll be able to **focus more** on **building insightful reports** and less on **troubleshooting** messy relationships and scattered measures.

PRO TIPS

- Arrange your **tables** logically in a **waterfall structure**—lookup tables at the top, fact tables below, supporting tables at the bottom, and measure groups to the side.
- **Resize tables** to **consistent shapes** to improve visual clarity and make relationships easier to follow.
- Organize **DAX calculations** into dedicated **measure tables** for better model management and faster reporting.
- Keep the **report view clean** by hiding **supporting tables** and measure groups that don't need to be visible.
- Maintain **consistency** by grouping measure tables in the **Query Editor** to simplify adjustments and updates.
- Hide **measure groups** to **reduce clutter** in the report view, while keeping them accessible in the model.

7

DAX Formulas

DAX (Data Analysis Expressions) is the formula language that powers Power BI's analytical capabilities. It allows you to create custom calculations, aggregate data, and perform advanced time-based analysis.

Understanding the difference between aggregating functions and iterating functions, as well as the concept of measure branching, will be pivotal as you build more advanced financial reports. With these foundational formulas, you'll be able to create dynamic and reusable measures that simplify your reporting process.

- Learn how to use functions like SUM, AVERAGE, and COUNT to perform simple aggregations across your data.

The screenshot shows the DAX editor interface. At the top, the formula bar contains `CALCULATE(Expression, [Filter1], ...)`. Below it, a tooltip explains: "Evaluates an expression in a context modified by filters." A second tooltip says: "Write a DAX expression that calculates a value from". The editor shows the following code:

```
1 CALCULATE( [Total Profits],  
2  
3
```

Below the code, a list of functions is shown, with `SAMEPERIODLASTYEAR` selected. Its tooltip reads: "Returns a set of dates in the current selection from the previous year." Below the list is a table of financial data:

Date	Total Sales	Total Costs	Total Profits	Profit Margins	Sales LY
16/10/2017	\$172,531.70	\$113,544.83	\$58,986.87	34.2%	\$208,423.
17/10/2017	\$29,151.70	\$18,346.88	\$10,804.82	37.1%	\$195,130.
18/10/2017	\$201,026.80	\$131,126.30	\$69,900.50	34.8%	\$213,381.
19/10/2017	\$113,558.30	\$78,114.22	\$35,444.08	31.2%	\$195,130.

- Understand how functions like **SUMX**, **AVERAGEX**, and **COUNTX** work by **iterating** over each row in a table, allowing for more complex calculations.
- Discover how to **build measures** that **reference existing measures**, creating a chain of calculations that are easy to maintain and modify.
- Utilize functions like **DATEADD** and **SAMEPERIODLASTYEAR** to perform **time-based comparisons** in your reports.

Starting with **basic measures** and building up to more **complex calculations** using **time intelligence functions** will set a strong foundation for your financial reporting. With these **formulas** in place, you're now ready to move into creating dynamic **report pages** with income statements, balance sheets, and more.

```

1 Sales Year to Date =
2 CALCULATE(
3     [Total Sales] ,
4     DATESYTD( Dates[Date] ) )

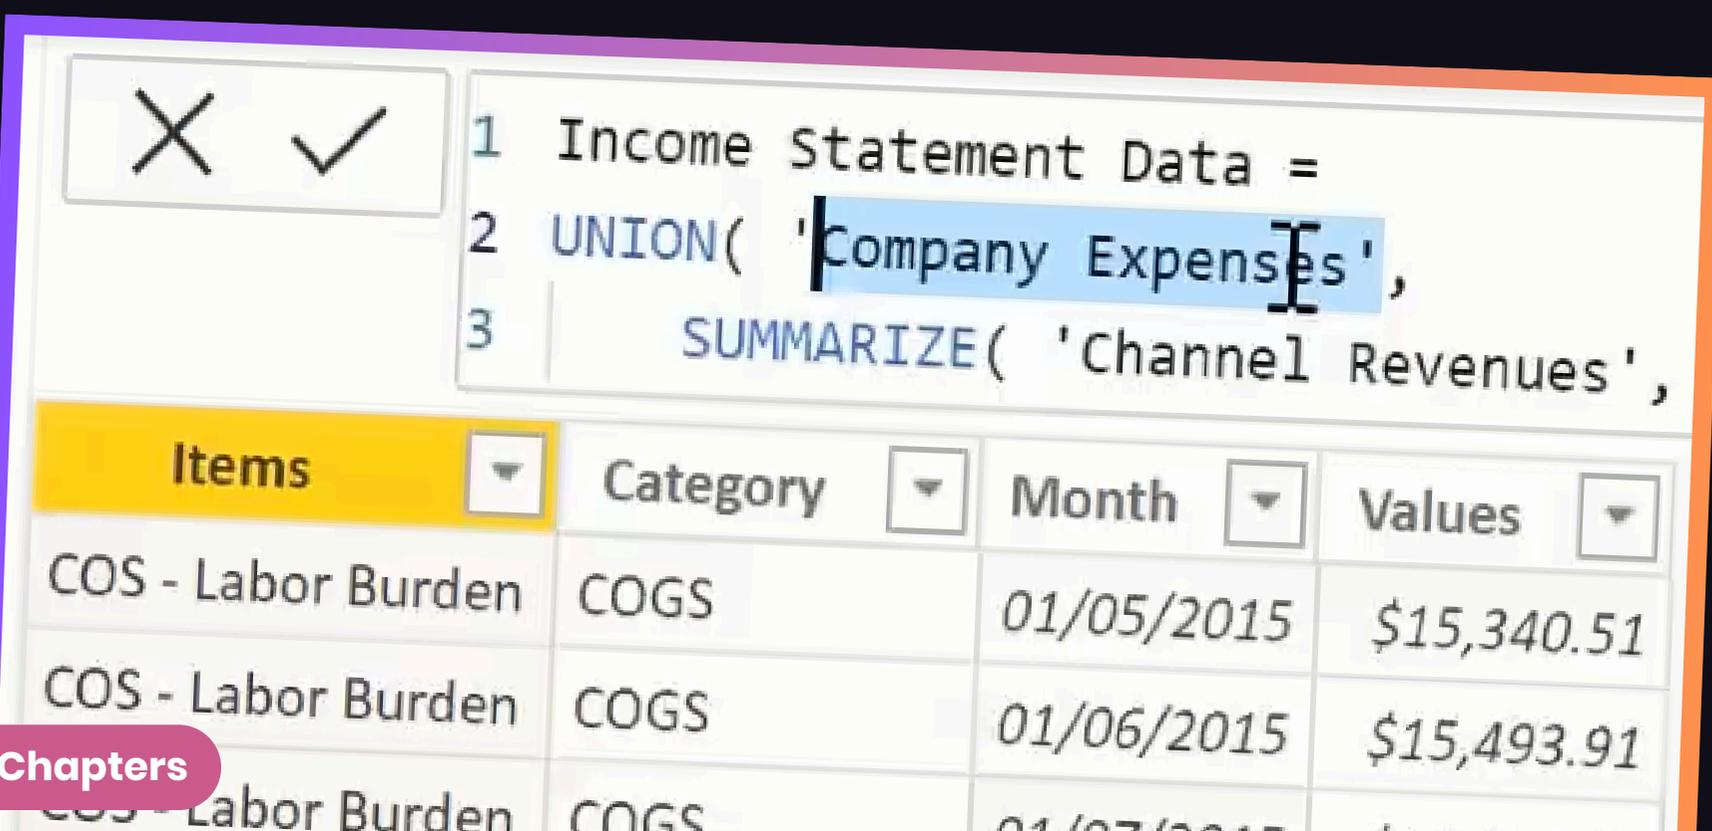

```

Date	Total Sales	Total Costs	Total Profits	Profit Margins	Sales LY	Profits LY	Sales TY vs LY
16/05/2017	\$98,657.50	\$63,504.01	\$35,153.49	35.6%	\$290,981.00	\$93,587.14	(\$192,323.50)
17/05/2017	\$148,780.20	\$97,102.70	\$51,677.50	34.7%	\$200,162.50	\$89,967.60	(\$51,382.30)
18/05/2017	\$172,551.80	\$97,022.63	\$75,529.17	43.8%	\$117,290.20	\$45,127.31	\$55,261.60
19/05/2017	\$119,521.30	\$85,757.92	\$33,763.38	28.2%	\$168,237.00	\$62,893.77	(\$48,715.70)
20/05/2017	\$81,458.60	\$47,440.02	\$34,018.58	41.8%	\$139,011.60	\$47,117.95	(\$57,553.00)
21/05/2017	\$289,895.60	\$204,152.15	\$85,743.45	29.6%	\$144,994.70	\$57,460.94	\$144,900.90
22/05/2017	\$85,431.70	\$49,174.65	\$36,257.05	42.4%	\$193,475.90	\$76,824.14	(\$108,044.20)
23/05/2017	\$218,768.40	\$136,268.35	\$82,500.05	37.7%	\$154,515.40	\$56,710.68	\$64,253.00
24/05/2017	\$216,477.00	\$149,212.95	\$67,264.05	31.1%	\$130,985.00	\$46,282.53	\$85,492.00
25/05/2017	\$70,698.40	\$34,140.52	\$36,557.88	51.7%	\$175,138.00	\$54,361.59	(\$104,439.60)
26/05/2017	\$207,472.20	\$130,870.36	\$76,601.84	36.9%	\$59,549.60	\$21,720.06	\$147,922.60
27/05/2017	\$96,225.40	\$75,318.85	\$20,906.55	21.7%	\$56,990.20	\$20,777.37	\$39,235.20
28/05/2017	\$133,939.70	\$73,225.64	\$60,714.06	45.3%	\$113,156.30	\$36,622.67	\$20,783.40
				39.3%	\$137,450.50	\$39,237.21	\$47,040.70

Explore adding **roll-ups** to **categorize** revenues and expenses, **sorting** them **correctly**, and creating initial DAX measures to populate the income statement template.

- Learn how to add a **calculated column** to **categorize data** into revenue and expense groups for your income statement.
- Understand how to use an **index column** to **control** the order of revenues and expenses in your report.
- Discover how to **organize** your **DAX measures** into **measure groups** to keep your model clean and structured.

By **categorizing** revenues and expenses, **sorting** them **appropriately**, and managing **positive** and **negative values**, your financial reports will be accurate and easy to interpret.

The screenshot shows a DAX measure definition in the formula bar and a corresponding table visualization. The measure is:

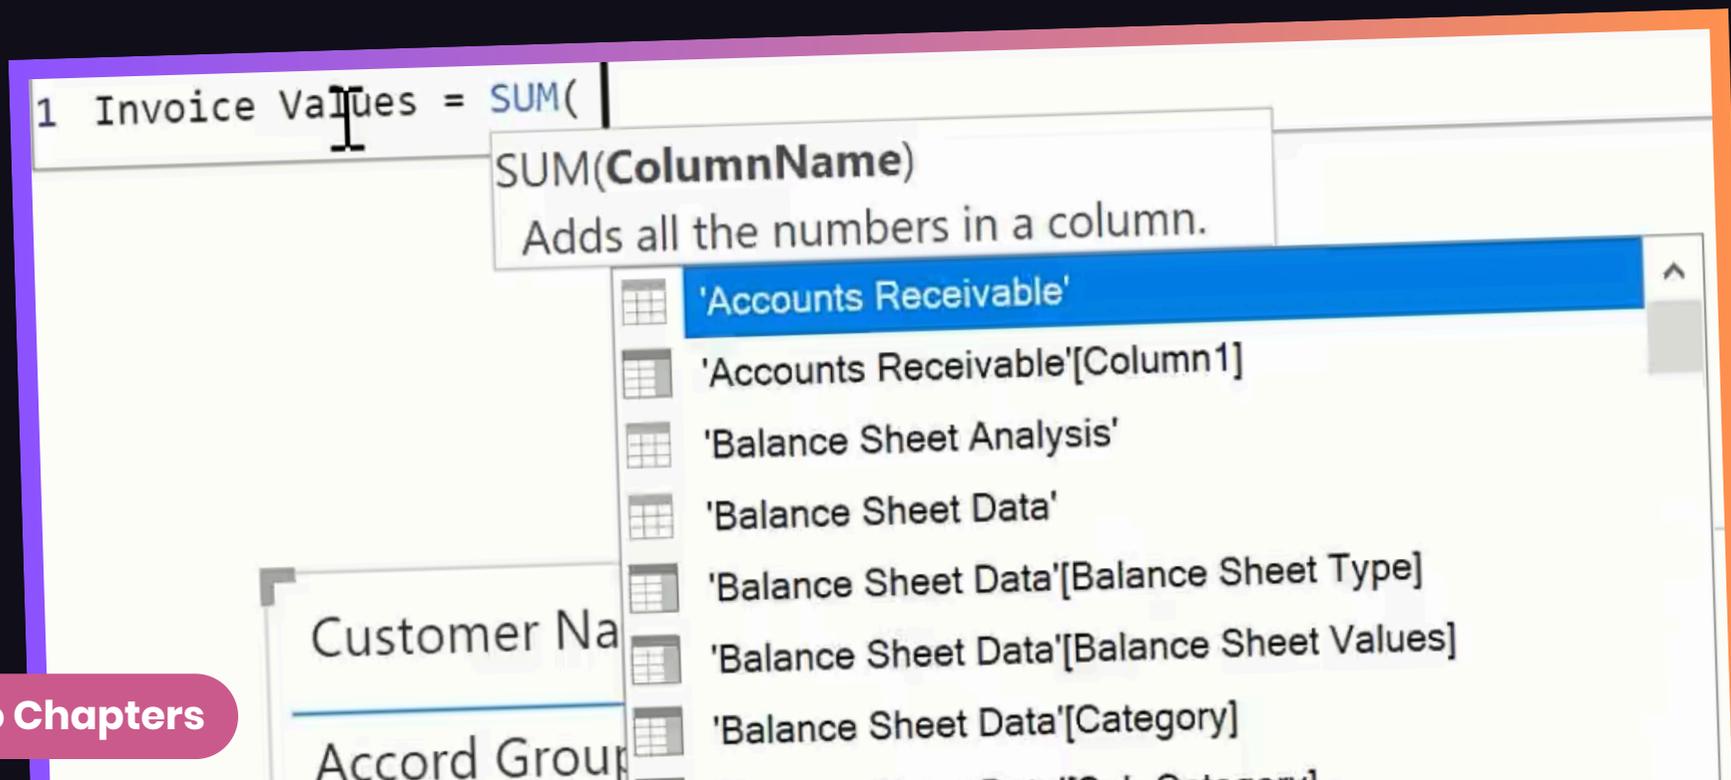

```
1 Income Statement Data =  
2 UNION( 'Company Expenses',  
3 SUMMARIZE( 'Channel Revenues',
```

The table below shows the data for the 'Company Expenses' measure:

Items	Category	Month	Values
COS - Labor Burden	COGS	01/05/2015	\$15,340.51
COS - Labor Burden	COGS	01/06/2015	\$15,493.91
COS - Labor Burden	COGS	01/07/2015	

Discover creating the **initial DAX formulas** required to dynamically **group invoices** based on their **aging** from a **selected date**. Explore calculating the selected date, invoice date, and due date, then progress to calculating the days left until an invoice is due while accounting for already-paid invoices.

- Learn to use **slicers** to **filter data** based on a selected date and calculate the state of play at any point in time.
- Understand how to **break down complex formulas** into manageable steps using **measure branching** to ensure accuracy and traceability.
- Use **DATEDIFF()** to calculate the difference in days between the due date and the selected date, a key step in dynamic grouping.
- Apply **IF()** and **AND()** statements to **filter out irrelevant invoices**, ensuring the report shows only active invoices as of the selected date.

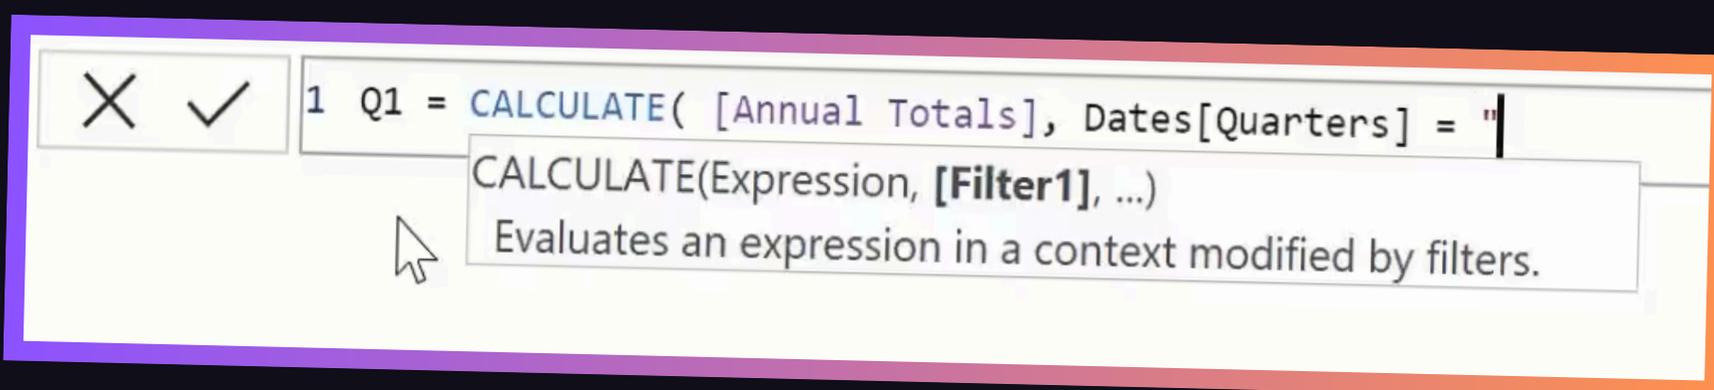

DAX formulas in Power BI are not just about generating **static calculations**—they offer the flexibility to create dynamic and interactive tables.

Explore how to use DAX to dynamically **break down annual totals** into **quarterly insights** and beyond.

You'll see how measure branching simplifies complex calculations and how you can quickly scale your reports by leveraging previously created measures.

- Learn how to **break down** annual **dynamic numbers** into **quarterly values** using DAX and understand how to utilize your date table to filter dynamic calculations by different time frames (quarter, month, year).
- See how previously **built measures** can be **reused** and **adapted** to various visualizations without rewriting complex formulas and explore how to sort short month names correctly in your date table to ensure reports display in the right order.

```
1 Q1 = CALCULATE( [Annual Totals], Dates[Quarters] = "Q1" )
```

CALCULATE(Expression, [Filter1], ...)
Evaluates an expression in a context modified by filters.

Discover creating **unique** and **dynamic insights** using advanced **DAX formula combinations**. Explore how to use iterating functions like **MAXX** and **AVERAGEX** to calculate dynamic values, such as the previous **highest sale** and **rolling average sales**, which update automatically based on any **report selection**. These techniques not only enhance your data analysis but also make your reports more interactive and insightful.

- Learn how to **filter tables** dynamically in **DAX** to ensure **calculations** are **context-aware** and **responsive** to report selections.
- Build dynamic **rolling measures** that automatically **update** based on **selected dates** or **filters** in your **Power BI report** and see how these unique **DAX formulas** can be incorporated into your visualizations to add depth and interactivity.

```
1 Rolling Average Sales =  
2 AVERAGEX(  
3     FILTER( ALLSELECTED( Dates ),  
4         Dates[Date] <= MAX( Dates[Date] ) ),  
5     [Total Sales] )
```

Territory

Channel

Multiple selections

All

PRO TIPS

- Always test your **DAX formulas** in a **table visual first** to understand how they behave across different contexts.
- Build your **measures** step-by-step by **referencing** existing measures. This approach is faster, cleaner, and more scalable.
- Use measures instead of **calculated columns** wherever possible. Measures are more efficient and flexible.
- Use **time intelligence functions** to create dynamic comparisons across different time periods.
- Apply **appropriate formatting** to your **measures** (e.g., currency, percentage) to make your reports more readable.
- Iterating **functions** perform **row-by-row calculations**, making them ideal for creating measures based on values that don't exist directly in your data table.

PRO TIPS

- Use **measure** branching to break down **complex formulas** into simpler steps. This makes it easier to debug and understand each part of your calculation.
- The **DATEDIFF()** function is a cleaner way to **calculate** the **difference** between two **dates** compared to subtracting date values directly. It allows you to specify the unit of time (e.g., days, months).
- Ensure your **report** only shows **relevant invoices** by **applying conditional logic**. This avoids confusion and ensures the data reflects the actual state as of the selected date.
- Always **add** your **measures** to a **table visual** to see if they calculate correctly before applying them to more complex visuals.

8

+ve/-ve Numbers

In **financial reporting**, it is crucial to manage **positive** and **negative numbers** correctly to ensure that your income statement calculations are accurate. In **Power BI**, you might encounter a situation where all values—both **revenues** and **expenses**—are positive, making your calculations meaningless without adjustments.

Discover how to create a **master measure** that handles **positive** and **negative numbers** appropriately.

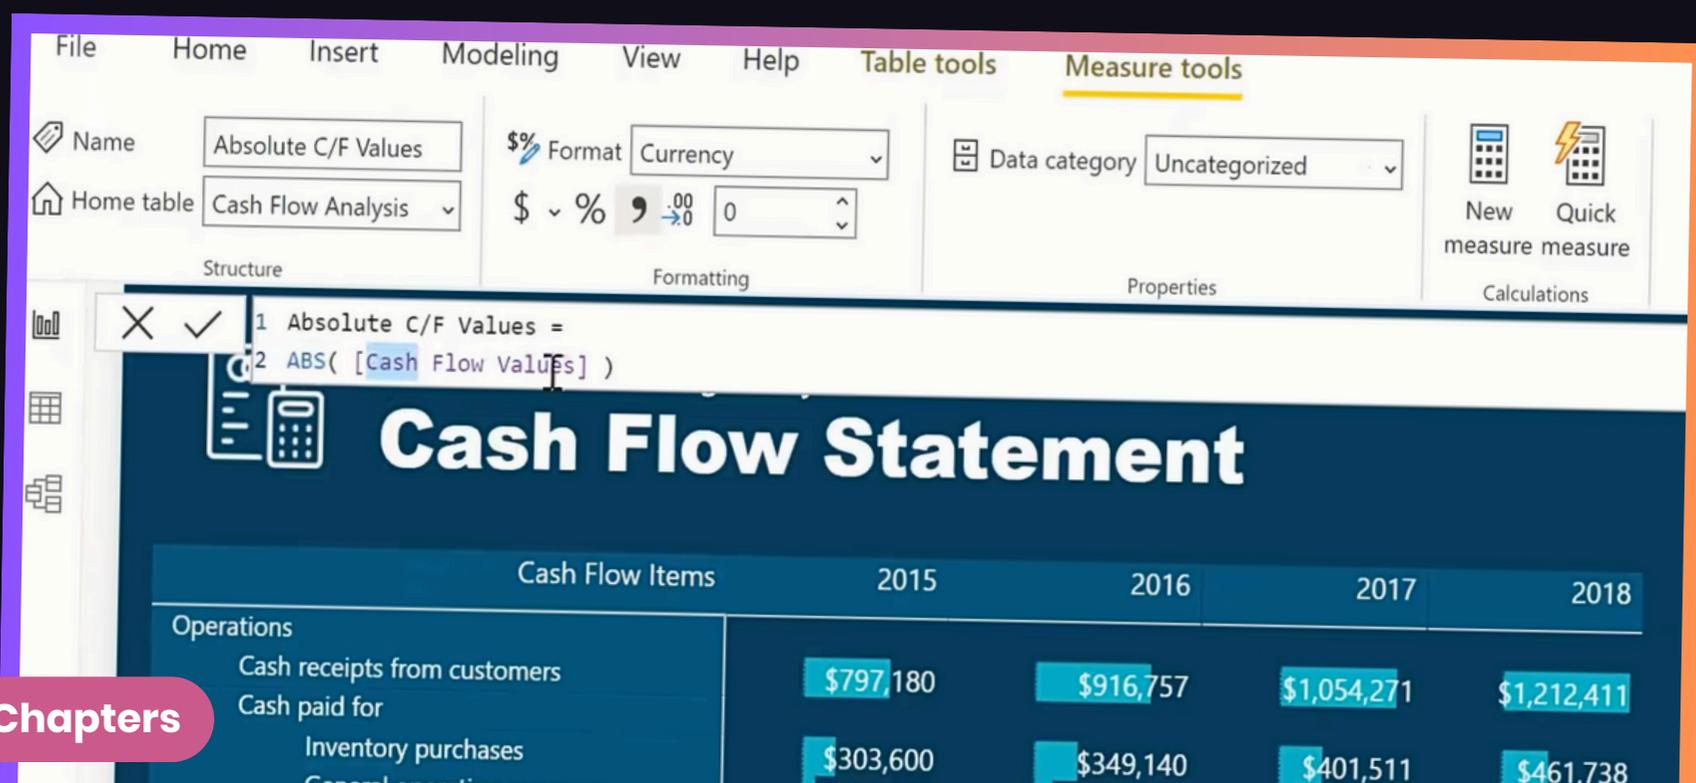

- Learn how to create a **master measure** called “**Actuals**” that can be **reused** and **branched** into other measures.
- Discover how to **simplify large values** by dividing them into **thousands**, making your financial report more concise.

```
1 Actuals (,000) =
2 VAR Revenue = CALCULATE( [Income Values], 'Income Statement Data'[Type] = "Revenues" )
3 VAR Expense = CALCULATE( [Income Values], 'Income Statement Data'[Type] = "Expenses" ) * -1
4 DIVIDE(Numerator, Denominator, [AlternateResult])
5 Safe Divide function with ability to handle divide by zero case.
6 DIVIDE(
7 IF( SELECTEDVALUE( 'Income Statement Data'[Type] ) = "Revenues", Revenue,
8 IF( SELECTEDVALUE( 'Income Statement Data'[Type] ) = "Expenses", Expense,
9 Revenue + Expense ) ), 1000, 0 |
```

Visualizing **cash flow activities** such as operations, investing, and financing can be **challenging** when dealing with **negative values**. Popular charts like donut charts and pie charts do not support negative values, which can cause issues when presenting data in a clear, visual format.

Explore how to **overcome** this **limitation** by creating **absolute value calculations** for cash flow data and applying **visual-level filters** to generate clean, dynamic visuals that break down cash in and cash out activities.

- Understand why **negative values** cause issues in **donut** and **pie charts**, and learn how to handle them by applying absolute value transformations.
- Learn how to use the **ABS()** function to transform **cash flow values** into absolute values for visualization purposes.

PRO TIPS

- Managing **positive** and **negative numbers** is critical in **financial reports**. Without proper signage, your income statement could display incorrect values, misleading your audience.
- Ensuring that **revenues** are **positive** and **expenses** are **negative** is crucial for accurate financial reporting.
- When working with **financial reports**, it's common to **deal** with **large numbers** in the millions or billions. Displaying such large numbers can clutter your report and make it harder to interpret.
- Using **IF statements** and **SELECTEDVALUE** allows your measure to adjust dynamically based on the type of data being displayed.
- Using variables in **DAX** allows you to **simplify** your **formulas** and **reduce redundancy**. Instead of repeating the same calculation multiple times, you can define a variable once and reuse it.

9

Rollup Subtotals Calculations

When creating **financial reports** in **Power BI**, it's essential to calculate **rollup subtotals** to structure your **income statement** correctly. These **subtotals**, such as revenues, cost of goods sold, and gross profit, need to be calculated individually using **DAX formulas**. Without these **measures**, your report will lack the **necessary context** to populate template sections accurately.

Learn how to create these **subtotals**, using **simple filtering** and **calculation techniques** that will serve as the foundation for building your income statement, balance sheet, and cash flow templates.

```
1 COGS =
```

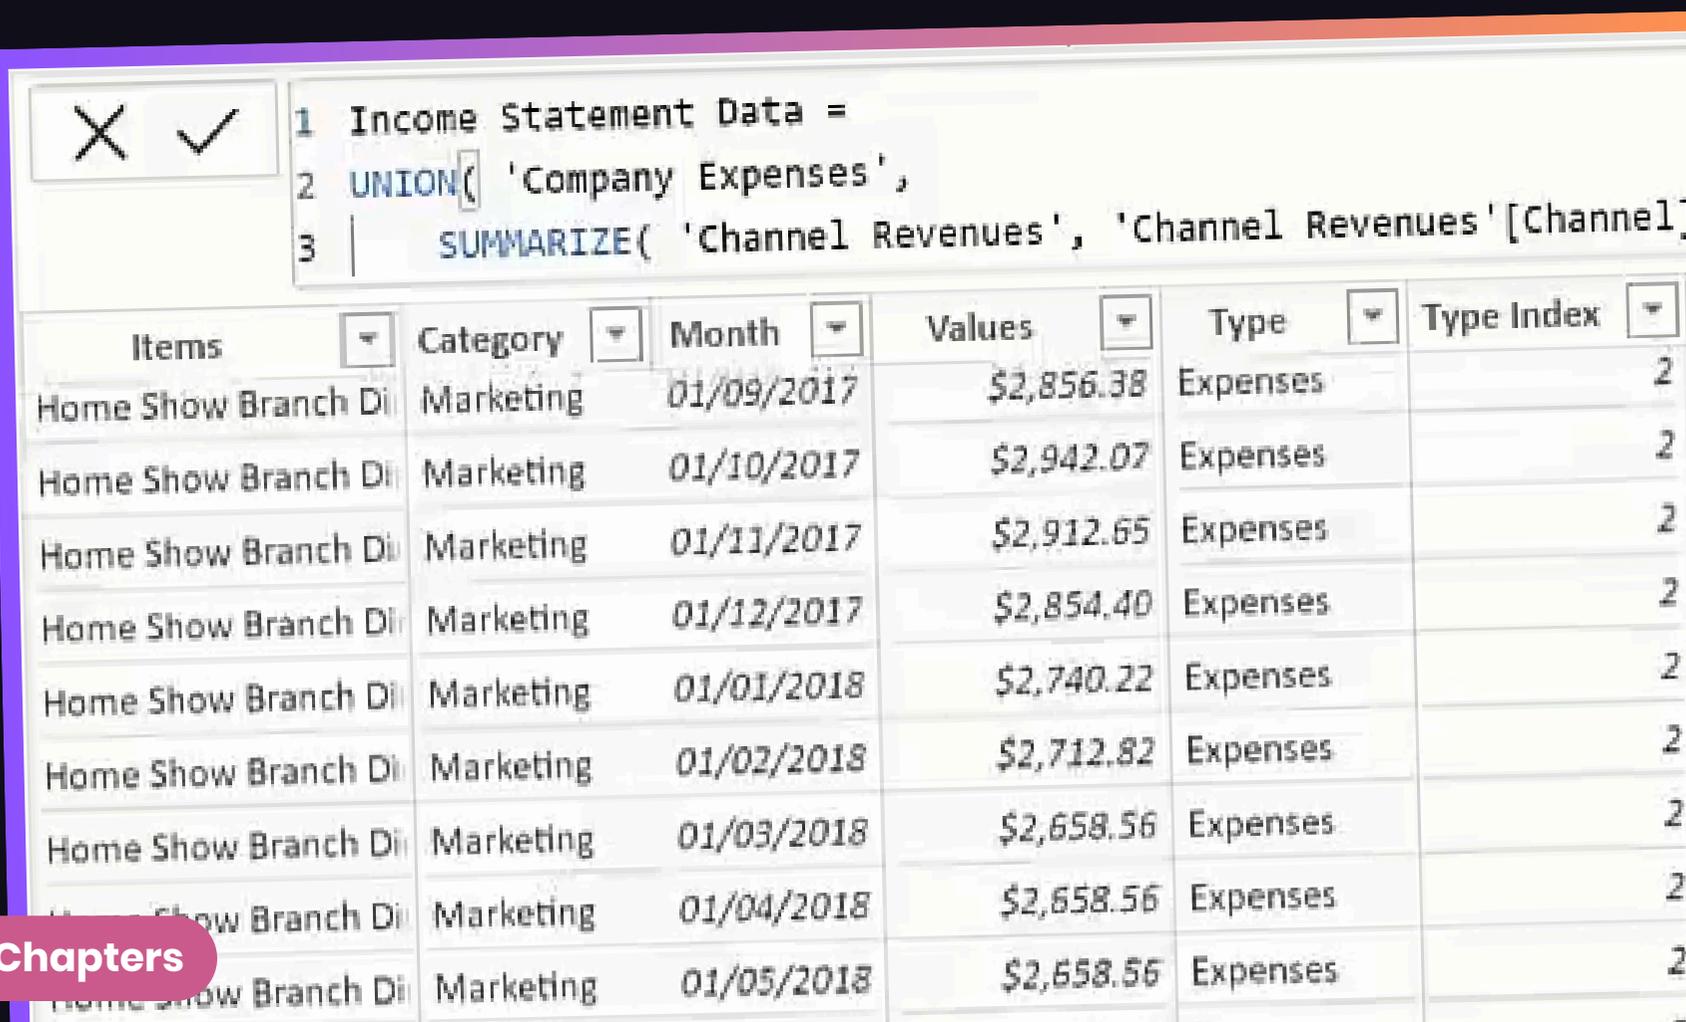

```
2 CALCULATE( val |
```

CALCULATE(**Expression**, [Filter1], ...)

Evaluates an expression in a context modified by filters.

- ⓧ COMBINEVALUES
- ⓧ DATEVALUE
- ⓧ FIRSTNONBLANKVALUE
- ⓧ HASONEVALUE
- 📊 [Income Values]
- ⓧ LASTNONBLANKVALUE

- Learn how to create **subtotals** that **summarize key sections** of your **financial data**, such as total revenues, cost of goods sold (COGS), gross profit, and net profit. These subtotals are essential for **structuring** your **income statement** and providing clarity to users.
- Discover how to take **large sets** of financial data and **break them down** into smaller, more manageable **DAX measures**. By calculating subtotals individually, you'll make your reports more efficient and easier to maintain.
- Understand how to **reuse existing measures** to create **new calculations** without rewriting **complex formulas**. This technique will save you time and improve the consistency of your financial models.

```
1 Income Statement Data =
2 UNION( 'Company Expenses',
3 | SUMMARIZE( 'Channel Revenues', 'Channel Revenues'[Channel]
```

Items	Category	Month	Values	Type	Type Index
Home Show Branch Di	Marketing	01/09/2017	\$2,856.38	Expenses	2
Home Show Branch Di	Marketing	01/10/2017	\$2,942.07	Expenses	2
Home Show Branch Di	Marketing	01/11/2017	\$2,912.65	Expenses	2
Home Show Branch Di	Marketing	01/12/2017	\$2,854.40	Expenses	2
Home Show Branch Di	Marketing	01/01/2018	\$2,740.22	Expenses	2
Home Show Branch Di	Marketing	01/02/2018	\$2,712.82	Expenses	2
Home Show Branch Di	Marketing	01/03/2018	\$2,658.56	Expenses	2
Home Show Branch Di	Marketing	01/04/2018	\$2,658.56	Expenses	2
Home Show Branch Di	Marketing	01/05/2018	\$2,658.56	Expenses	2

PRO TIPS

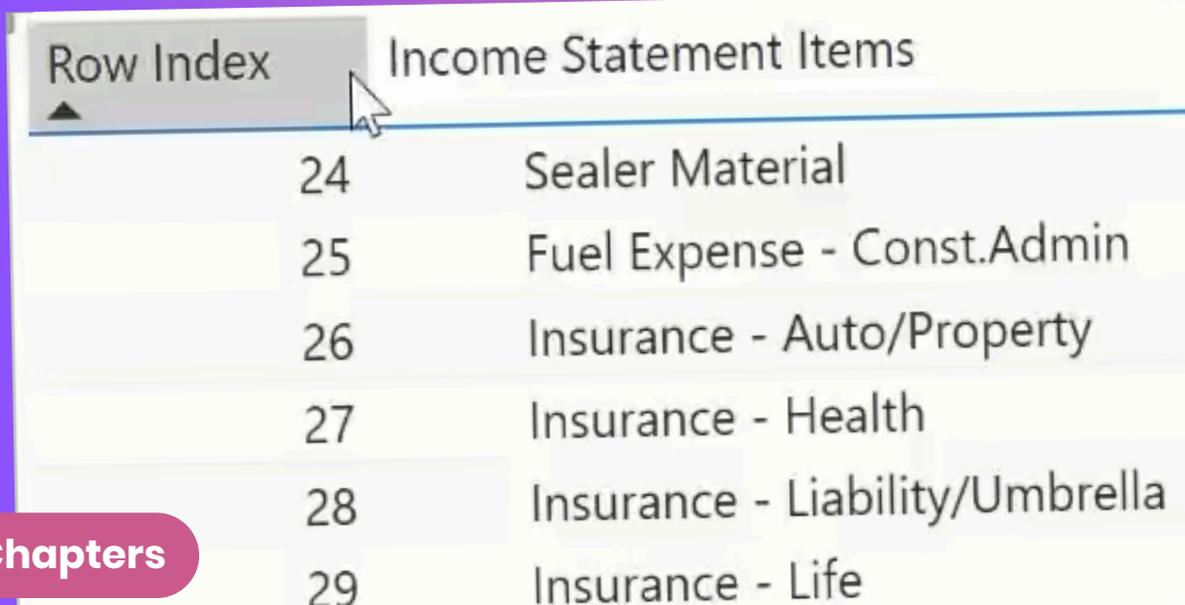

- Begin by calculating simple **subtotals** like **revenues** and **COGS** before moving on to more complex measures. This step-by-step approach ensures accuracy and builds a strong foundation for your report.
- Always ensure that **expenses** are **represented** as **negative numbers**. This makes it easier to calculate net profit and display accurate subtotals in your report.
- Reuse **existing measures** to create new ones through **measure branching**. For example, use your revenues and COGS measures to calculate gross profit without rewriting the entire formula.
- Where possible, use **variables** to **simplify** your **DAX formulas**. Variables make your formulas cleaner, easier to read, and more efficient.
- Always refer back to your **income statement template** when creating measures.

10

Template Embedding

Learn how to **map** the **template** structure from **Excel** into **Power BI**, manage row ordering, and **format** the table correctly to display your **subtotals**, spaces, and indentations.

- Explore how to take your **existing financial templates**, such as income statements, and transform them into **Power BI tables** that retain the **structure** and **formatting** you designed in Excel.
- Discover the **importance** of a **row index** to ensure that your **template** items appear in the correct order inside your **Power BI report**, even when new data is added.

A screenshot of a table in a Power BI report. The table has two columns: 'Row Index' and 'Income Statement Items'. The 'Row Index' column contains numerical values from 24 to 29. The 'Income Statement Items' column contains text descriptions of expenses. A mouse cursor is pointing at the 'Row Index' header.

Row Index	Income Statement Items
24	Sealer Material
25	Fuel Expense - Const.Admin
26	Insurance - Auto/Property
27	Insurance - Health
28	Insurance - Liability/Umbrella
29	Insurance - Life

PRO TIPS

- Embedding templates into Power BI allows you to create standardized financial reports across different models.
- Sorting by row index is a key technique for ensuring that your financial reports display correctly.
- Financial reports are often divided into sections, such as revenues, COGS, and expenses. Maintaining gaps between these sections improves readability and makes your report more professional.
- Power BI's default settings for tables may include Word Wrap, which can make your tables look messy.
- Before finalizing your report, test your template with sample data to ensure that all items appear correctly and the formatting is consistent. Adjust row index values or DAX formulas as needed to fine-tune the report.

11

DAX Design Integration

Embedding **DAX calculations** into a **financial template** in **Power BI** requires a smart approach to dynamically associate values with their corresponding rows in the template.

Learn how to use **SWITCH TRUE logic** to connect your **calculated values** to their respective positions in a financial template.

- Explore how to **apply different formats** (e.g., percentages) within the **same measure** using the **FORMAT** function.
- Understand how to apply **virtual filters** in **DAX** to **calculate** values based on the **context** of the current row.

```
1 Selected Year Actuals =  
2 VAR CurrentItem = SELECTEDVALUE( 'Income Statement Template'[Items (Normalized)] )  
3  
4 RETURN  
5 SWITCH( TRUE(),
```

SWITCH(Expression, **Value1**, Result1, ..., [Else])

Returns different results depending on the value of an expression.

Distributor

Export

Wholesale

Total Revenues

PRO TIPS

- Using variables in **DAX formulas** makes your code **more readable** and **efficient**. For example, defining CurrentItem once and using it throughout the formula reduces redundancy and improves performance.
- The **SWITCH TRUE function** is an essential tool for **mapping calculations to template rows**. It allows you to handle multiple conditions within a single measure, simplifying your DAX code.
- Virtual filters in **DAX** enable you to dynamically **filter data** based on the **context** of the **current row**. This technique is particularly useful when dealing with financial templates that include both subtotals and detailed line items.
- The **FORMAT function** allows you to apply **different formats** (e.g., currency, percentage) within the same DAX formula. This is especially useful when working with financial reports that display different types of values in the same column.

12

Time Comparison Calculations

Time comparison calculations are essential for any financial report, providing valuable insights by showing how performance changes over time.

Understanding how to create last year's subtotals for key financial metrics like revenue, cost of goods sold (COGS), and net profit will help you see trends and performance changes from one period to another.

- Learn how to use DAX functions like DATEADD and SAMEPERIODLASTYEAR to calculate previous year values.
- Understand how to calculate key financial metrics such as Revenues Last Year, COGS Last Year, and Net Profit Last Year.

```
1 Previous Year Actuals =
2 VAR CurrentItem = SELECTEDVALUE( 'Income Statement Template'[Items (Normalized)] )
3
4 RETURN
5 SWITCH( TRUE(),
6     CurrentItem = "Total Revenues" , DIVIDE( [Revenues LY], 1000, 0 ),
7     CurrentItem = "Total COGS" , DIVIDE( [COGS LY], 1000, 0 ),
8     CurrentItem = "Total Gross Profit", DIVIDE( [Gross Profit LY], 1000, 0 ),
9     CurrentItem = "Total Other Expenses", DIVIDE( [Other Expenses LY], 1000, 0 ),
10    CurrentItem = "Total Net Profit", DIVIDE( [Net Profit LY], 1000, 0 ),
11    CurrentItem = "Gross Profit %", FORMAT( [Gross Margins LY], "0.00%" ),
12    CurrentItem = "Net Profit Margin %", FORMAT( [Net Profit Margin LY], "0.00%" ),
```

PRO TIPS

- The **DATEADD** function provides more flexibility than **SAMEPERIODLASTYEAR**, allowing you to **shift dates** by months, quarters, or years.
- Define **key metrics** like Revenues Last Year and COGS Last Year as **variables** within your **master measure** to reduce redundancy.
- Use the **FORMAT** function to apply different **formats** within the **same measure**. This is especially useful for metrics like gross margin percentages, which require a different format than dollar values.
- **Virtual filters** allow you to dynamically **calculate values** based on the current row in the template.
- Always test your **time comparison calculations** in a **table visual** before applying them to your final report. This helps you identify any errors or inconsistencies in your calculations.

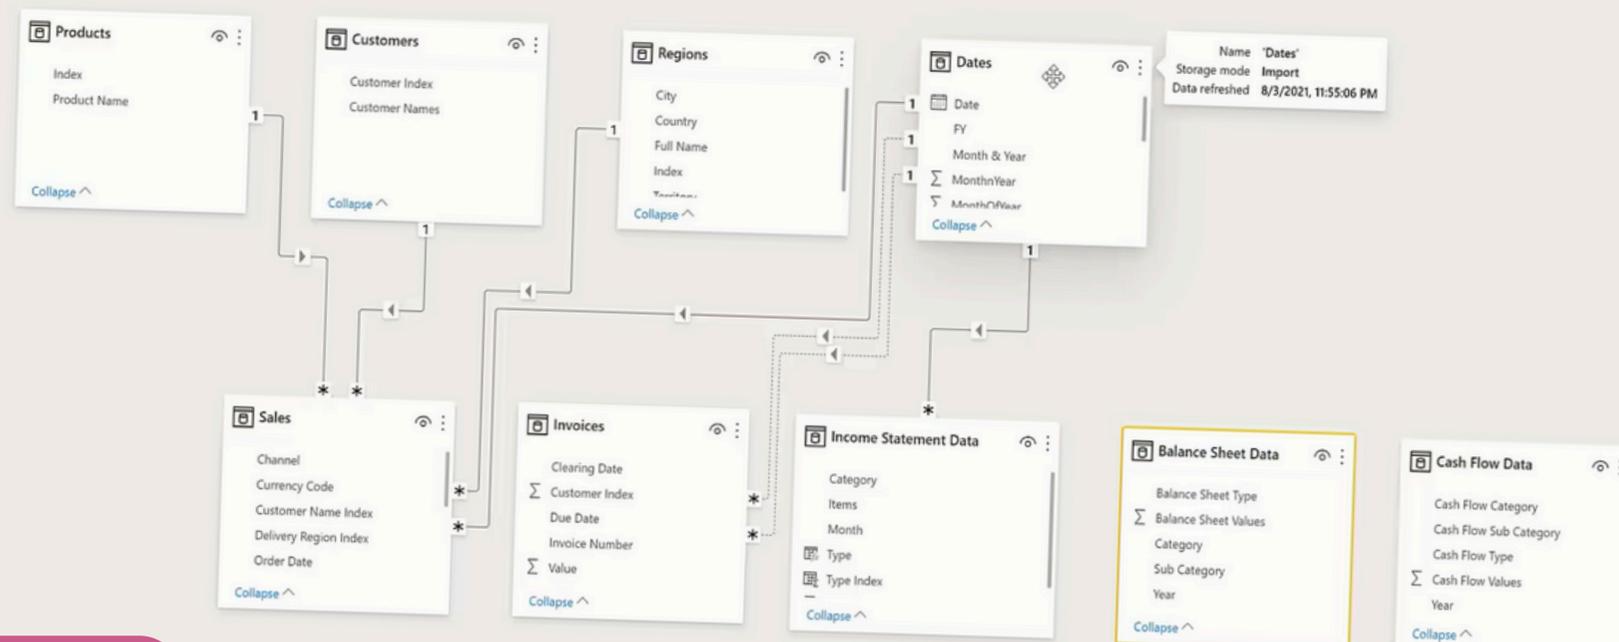

13

Data Managing

Explore how to **manage data** at **different granularities** when creating balance sheet and cash flow reports in **Power BI**. Unlike the income statement, where **relationships** between **tables** are more straightforward, balance sheet and cash flow data require a different approach due to their **granular differences** and **lack of direct relationships** to the **date table**.

Discover how to handle **balance** sheet and cash flow data, even without creating **physical relationships** in your data model.

- Learn why balance sheet and cash flow data require **different handling** compared to **income statement** data due to their unique granularity.

- Discover why **many-to-many relationships** can complicate your **model** and how to avoid them by using virtual relationships.
- Explore the **TREATAS** function, which allows you to **apply filters** from **one table** to another without creating physical relationships.

Managing **data** at **different granularities** is a critical skill for **financial reporting** in **Power BI**. By using virtual relationships with the **TREATAS** function, you can dynamically filter balance sheet and cash flow data without creating physical relationships. This approach keeps your model clean and efficient while providing accurate, filtered results.

The screenshot shows the Power BI DAX editor interface. The measure name is 'TY vs PY Actuals' and it is based on the 'Income Analysis' table. The DAX formula is as follows:

```
1 TY vs PY Actuals =  
2 VAR CurrentItem = SELECTEDVALUE( 'Income Statement Template'[Items (Normalized)]  
3  
4 RETURN  
5 SWITCH( TRUE(),  
6     CurrentItem = "Total Revenues" , DIVIDE( [Revenues] - [Revenues LY], 1000, 0  
7     CurrentItem = "Total COGS" , DIVIDE( [COGS] - [COGS LY], 1000, 0 ),  
8     CurrentItem = "Total Gross Profit", DIVIDE( [Gross Profit] - [Gross Profit LY]  
9     CurrentItem = "Total Other Expenses", DIVIDE( [Other Expenses] - [Other Exper  
10    CurrentItem = "Total Net Profit", DIVIDE( [Net Profit] - [Net Profit LY], 100  
11    CALCULATE( [Actuals (,000)], FILTER( 'Income Statement Data', 'Income Sta  
12    CALCULATE(  
13    CALCULATE( [Actuals (,000)], FILTER( 'Income Statement Data', 'In  
14    DATEADD( Dates[Date], -1, YEAR ) )
```

Below the formula, a table of values is visible:

COS - Equipment	(\$148.82)
COS - Labor Burden	(\$180.80)
COS - Materials	(\$4,262.11)
COS - Other Costs	(\$961.19)

PRO TIPS

- Power BI allows **many-to-many relationships**, but they can create ambiguous **filtering paths** and slow down your model.
- Creating **unnecessary relationships** can **clutter your model** and make it harder to maintain. Using **virtual relationships** keeps your model clean, reduces the number of physical relationships, and improves performance.
- Before applying your **measures** to **complex visuals**, test them in a table visual to ensure they are working as expected.
- The same **TREATAS technique** can be applied to your **Cash Flow Data**. Create a separate measure group for cash flow analysis and use TREATAS to apply year filters from the Dates table.

14

SWITCH/TRUE Logic

Explore creating a master **DAX formula** using **SWITCH/TRUE logic** to dynamically **populate** a **balance sheet template** in **Power BI**. This approach will allow us to **automate** the **placement** of balance sheet values and financial ratios into the correct rows of our report, making it **easy** to **switch** between different years and contexts.

- Learn how to use **SWITCH/TRUE logic** to **identify** and **populate** the correct rows in your template based on your normalized balance sheet structure.
- Discover how to **calculate** and **format subtotals** and **common financial ratios** directly within your master formula to streamline your report-building process.

```
1 B/S Values =
2 VAR CurrentItem = SELECTEDVALUE( 'Balance Sheet Template'[Balance Sheet Normalized] )
3
4 RETURN
5 SWITCH( TRUE(),
6     CurrentItem = "Total current assets", [Current Assets],
7     CurrentItem = "Total Fixed Assets", [Fixed Assets],
8     CurrentItem = "Total Other Assets", [Other Assets],
9     CurrentItem = "Total Assets", [Total Assets],
10    CurrentItem = "Total Current Liabilities", [Current Liabilities],
11    CurrentItem = "Total Long-Term Liabilities", [Long-Term Liabilities],
12    CurrentItem = "Total Owner's Equity", [Owners Equity],
13    CurrentItem = "Total Liabilities and Owner's Equity", [Liabilities and Owners Equity],
14    CurrentItem = "Debt Ratio (Total Liabilities / Total Assets)", FORMAT( DIVIDE( [Current Liabilities] + [Long-Term Liabilities], [Total Assets], 0 ), "0.00" ),
15    CurrentItem = "Current Ratio (Current Assets / Current Liabilities)", FORMAT( DIVIDE( [Current Assets], [Total Assets], 0 ), "0.00" ),
16    CurrentItem = "Current Ratio (Current Assets / Current Liabilities)", FORMAT( [Current Assets] - [Current Liabilities], "0" ),
17    CurrentItem = "Working Capital (Current Assets - Current Liabilities)", FORMAT( DIVIDE( [Total Assets], [Owners Equity], 0 ), "0.00" ),
18    CurrentItem = "Assets-to-Equity Ratio (Total Assets / Owner's Equity)", FORMAT( DIVIDE( [Total Assets], [Owners Equity], 0 ), "0.00" ),
19    CurrentItem = "Debt-to-Equity Ratio (Total Liabilities / Owner's Equity)", FORMAT( DIVIDE( [Current Liabilities] + [Long-Term Liabilities], [Owners Equity], 0 ), "0.00" ),
20    CALCULATE( [BS Values], FILTER( 'Balance Sheet Data', 'Balance Sheet Data'[Sub Category] = CurrentItem ) )
21 )
```

Property, plant, and equipment
(Less accumulated depreciation)
Intangible assets

Total fixed assets

CURRENCY Returns the value as a currency data type.
[Current Assets]
[Current Liabilities]
CurrentItem

Now that we've created and applied our SWITCH/TRUE logic measure to dynamically populate the balance sheet template, it's time to refine the visual design of our report. Explore how to optimize the balance sheet view by displaying it by year using a matrix visual, ensuring that subtotals and summary calculations are presented correctly without unnecessary duplications from Power BI's built-in features.

- Understand how to turn off built-in subtotals and grand totals in Power BI to avoid redundancy, ensuring that your custom measures take precedence.
- Learn how to transition from a table visual to a matrix visual to dynamically display balance sheet items by year.
- Discover how TreatAs enables you to filter your balance sheet data by year even without physical relationships between tables.

Balance Sheet Items	2015	2016	2017	2018	Total
Assets					
Current Assets					
Cash	\$11,875.15	\$11,876.30	\$11,877.45	\$11,878.60	\$47,507.50
Accounts receivable	\$4,216.15	\$4,217.30	\$4,218.45	\$4,219.60	\$16,871.50
Inventory	\$2,146.15	\$2,147.30	\$2,148.45	\$2,149.60	\$8,591.50
Prepaid expenses	\$355.15	\$356.30	\$357.45	\$358.60	\$1,427.50
Short-term investments	\$255.15	\$256.30	\$257.45	\$258.60	\$1,027.50
Total current assets	\$18,847.75	\$18,853.50	\$18,859.25	\$18,865.00	\$75,425.50
Fixed (Long-Term) Assets					
Long-term investments	\$1,209.15	\$1,210.30	\$1,211.45	\$1,212.60	\$4,843.50
Property, plant, and equipment (Less accumulated depreciation)	\$15,341.15	\$15,342.30	\$15,343.45	\$15,344.60	\$61,371.50
Intangible assets	(\$2,198.85)	(\$2,197.70)	(\$2,196.55)	(\$2,195.40)	(\$8,788.50)
Total fixed assets	\$16,567.60	\$16,572.20	\$16,576.80	\$16,581.40	\$66,298.00
Deferred income tax	\$388.30	\$390.60	\$392.90	\$395.20	\$1,567.00
Other					

PRO TIPS

- Use **variables** in your formulas to make them **cleaner** and **more efficient**. Variables also help improve performance by reducing redundant calculations.
- Instead of creating **separate measures** for each **financial ratio**, incorporate them directly into your **SWITCH/TRUE logic**. This makes your model more streamlined and efficient.
- Leverage **virtual filters** in **CALCULATE** to dynamically filter values based on the **current row** in your template. This eliminates the need for physical relationships and keeps your data model cleaner.
- Always test your **measures** in a **table visual** to ensure they produce the **expected results** before embedding them in more complex visuals. This helps you catch errors early and understand how your formula behaves in different contexts.

15

Summary Table

Learn how to **extract key financial ratios** from our balance sheet table and present them in a separate **summary table**.

Applying **filters** and leveraging **templated structures** will allow you to **reuse existing measures** and present **key insights** more concisely without duplicating work.

- Learn how to **reuse your existing balance sheet table** to create custom **summary visuals** with minimal effort.
- Understand how to apply **field filters** to **target specific rows** in your **templated table**, allowing you to showcase only key financial ratios.

Balance Sheet Items	2015	2016	2017	2018
Total Other Assets	\$460.30	\$462.60	\$464.90	\$467.20
Total Assets	\$35,875.65	\$35,888.30	\$35,900.95	\$35,913.60
Liabilities and Owner's Equity				
Current Liabilities				
Accounts payable	\$8,061.15	\$8,062.30	\$8,063.45	\$8,064.60
Short-term loans	\$201.15	\$202.30	\$203.45	\$204.60
Income taxes payable	\$3,146.15	\$3,147.30	\$3,148.45	\$3,149.60
Accrued salaries and wages	\$51.15	\$52.30	\$53.45	\$54.60
Unearned revenue	\$334.15	\$335.30	\$336.45	\$337.60
Current portion of long-term debt	\$1.15	\$2.30	\$3.45	\$4.60
Total current liabilities	\$11,794.90	\$11,801.80	\$11,808.70	\$11,815.60
Long-Term Liabilities				
Long-term debt	\$3,451.15	\$3,452.30	\$3,453.45	\$3,454.60
Deferred income tax	\$388.30	\$390.60	\$392.90	\$395.20
Total Long-Term Liabilities	\$438.45	\$441.90	\$445.35	\$448.80

PRO TIPS

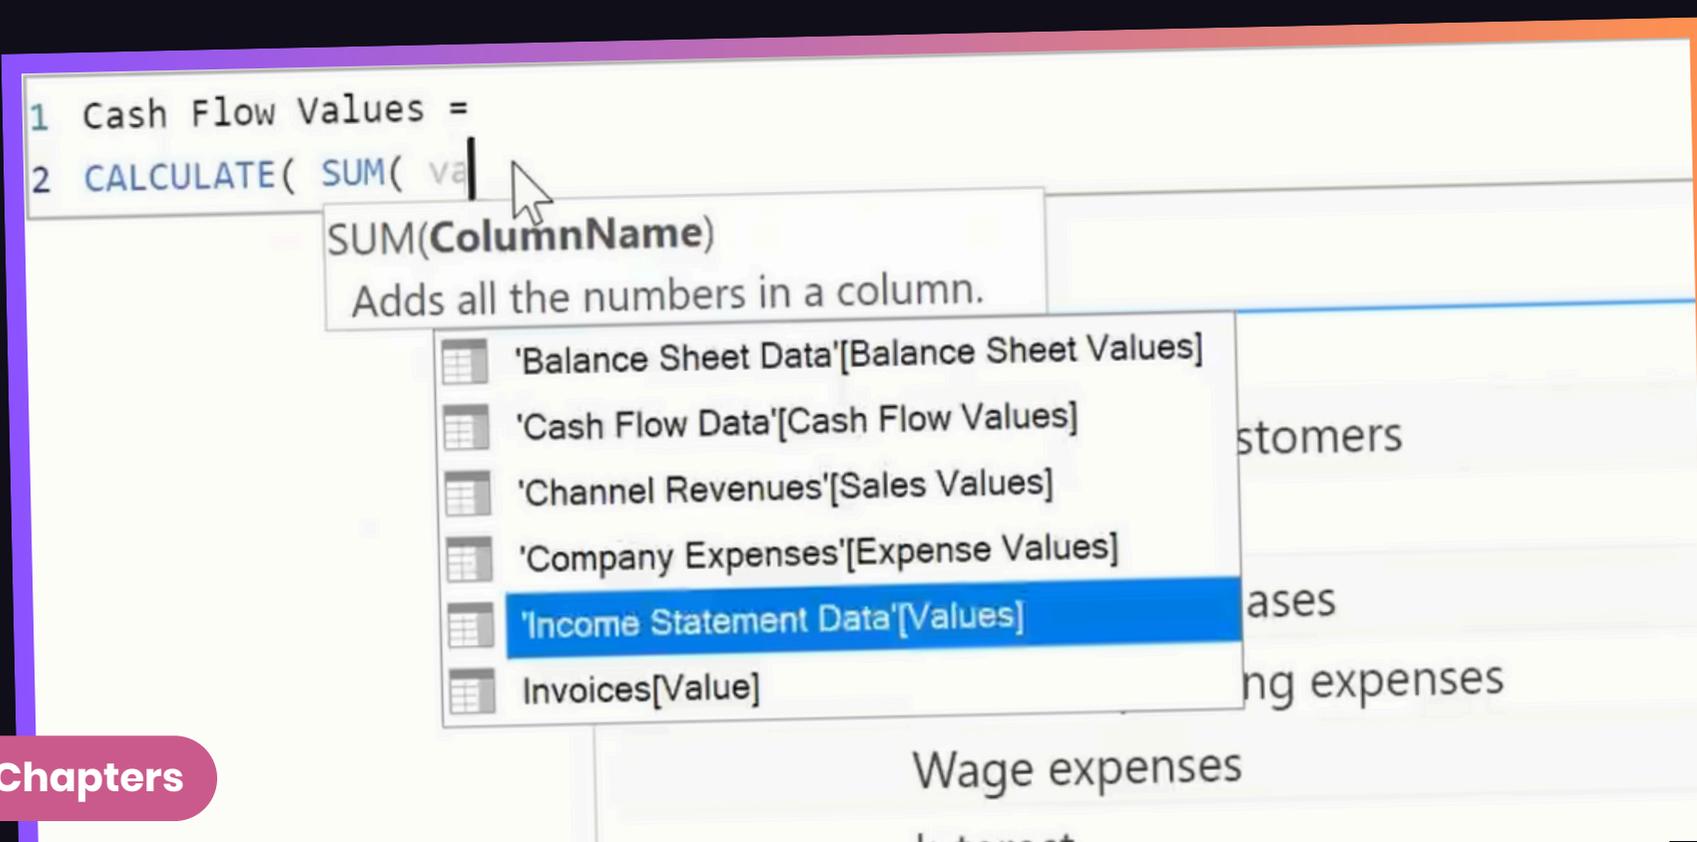

- Instead of creating **new visuals** from **scratch**, reuse your **templated tables** to save time. The work you've done in setting up the template and calculations can be easily repurposed to create new insights.
- Applying **field filters** allows you to **extract specific rows** or categories from your **templated table**. This approach is far more efficient than creating new measures for every subset of data you want to showcase.
- To maintain clean and concise reports, **avoid** showing the **same values** in **multiple places**. If you create a standalone summary table, consider removing those values from the original table to avoid confusion.
- You can further **customize** your **summary table** by applying **additional filters**. For example, you can create a time-based filter to show how financial ratios have changed over time.

16

DAX Functions

Discover creating the **cash flow statement** in **Power BI**, using **DAX functions** to build a dynamic report template. The cash flow statement is often **more unique** and **complex** than other **financial reports**, with categories like operating activities, investing activities, and financing activities.

- Learn how to create **virtual relationships** to filter your **cash flow data** by year without creating a physical relationship in the data model.
- Understand how to **integrate** your **cash flow template design** into **Power BI** for a fully dynamic report and create an initial **DAX measure** to sum up your cash flow values and connect them to your report template.

PRO TIPS

- Instead of creating a **many-to-many relationship** in your model, use the **TREATAS function** to establish a virtual relationship. This keeps your data model cleaner and more efficient.
- Ensure your **cash flow template** is **properly formatted** before creating your **DAX calculations**. This includes adjusting row headers, column headers, and word wrap settings to make your table look professional and easy to read.
- The **cash flow statement** can be **broken down** into Operating, Investing, and Financing Activities, and ensure your **measures** are structured to **align** with these sections.
- Always begin with a **master calculation** that **sums** your **values** and **applies filters** as needed. This measure will serve as the foundation for all subsequent subtotals and calculations.

17

Summary Totals

Explore calculating the **summary totals** and **subtotals** required for your **cash flow statement**. These subtotals are critical for breaking down your **cash flow data** into meaningful sections, such as operating activities, investing activities, and financing activities.

Discover creating **measures** for cash receipts and cash payments, calculate net cash flows, and ensure that the beginning and ending cash balances are correctly **included** that can be dynamically displayed in your **cash flow template**.

- Learn how to **calculate** the **key subtotals** for operating, investing, and financing activities using **DAX measures**.

```
1 Cash Paid For - Financing =  
2 CALCULATE( [Cash Flow Values],  
3     FILTER( 'Cash Flow Data',  
4         'Cash Flow Data'[Cash Flow Category] = "Cash paid for" &&  
5         'Cash Flow Data'[Cash Flow Type] = "Financing Activities" ))
```

Cash receipts from customers

Cash paid for

Inventory purchases

General operating expenses

Wage expenses

PRO TIPS

- Keep your **measure names consistent and descriptive**. For example, use names like Cash Flow from Operations (Receipts) and Cash Flow from Operations (Payments) to make it clear what each measure represents.
- When creating **subtotals**, ensure that your **filters** are **accurate**. Double-check your data to ensure you're capturing the correct cash receipts and cash payments for each section.
- Use **measure branching** to **automate** the **calculation** of net cash flows by subtracting payments from receipts. This approach makes it easier to maintain your model and update it if your data changes.
- Refer back to your **cash flow template** to ensure you're capturing all **necessary subtotals**. The template design should guide your measure creation process.

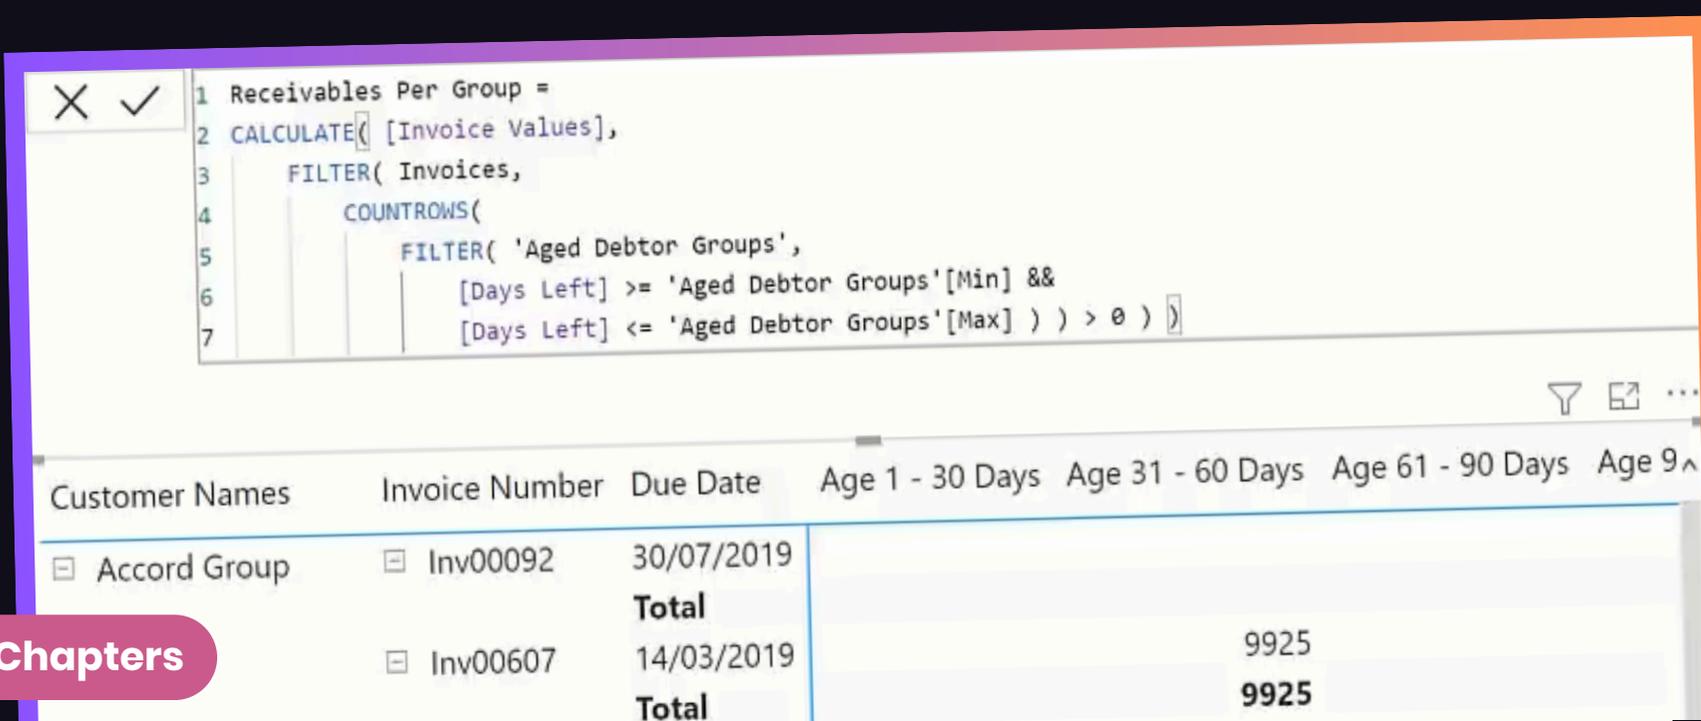

18

Dynamic Grouping

Explore advanced **dynamic grouping techniques** to **categorize invoices** based on their aging status from a selected date. This technique is **highly reusable** and **applicable** to a wide range of grouping scenarios in Power BI.

Discover creating a **dynamic grouping table**, implement a **DAX formula** to categorize invoices into specific **aging buckets**, and build a **summary table** that displays the grouped totals.

- Learn to create a **custom grouping table** in **Power BI**, which is essential for dynamic group-based analysis.
- Discover how to use **DAX filters** to **iterate** through **rows of a table** and evaluate if data belongs in a specific group.

The screenshot shows a DAX formula in the editor and a corresponding data table. The DAX formula is:

```
1 Receivables Per Group =  
2 CALCULATE([Invoice Values],  
3     FILTER( Invoices,  
4         COUNTROWS(  
5             FILTER( 'Aged Debtor Groups',  
6                 [Days Left] >= 'Aged Debtor Groups'[Min] &&  
7                 [Days Left] <= 'Aged Debtor Groups'[Max] ) ) > 0 ) )
```

The data table below shows the results of this calculation, grouped by Customer Names and Invoice Number. The columns represent different aging buckets: Age 1 - 30 Days, Age 31 - 60 Days, Age 61 - 90 Days, and Age 91+ Days.

Customer Names	Invoice Number	Due Date	Age 1 - 30 Days	Age 31 - 60 Days	Age 61 - 90 Days	Age 91+ Days
Accord Group	Inv00092	30/07/2019				
	Total			9925		
	Inv00607	14/03/2019				
	Total			9925		

PRO TIPS

- The key to **dynamic grouping** is creating a **separate grouping table**. This table must contain the group names, sort order, and range boundaries (Min/Max values).
- The **dynamic grouping formula** is **reusable** across **different reports**. Simply adjust the grouping table to suit your needs.
- Break down **complex formulas** into **smaller measures** to make your calculations more efficient and easier to debug.
- Ensure your **dynamic grouping formula** works with **various date selections** and data sets to verify accuracy.
- Always start with a **dedicated grouping table** for **flexibility**. It allows for easy adjustments without modifying formulas.

Dynamic Visualization

Dynamic visualizations allow users to interact with their financial data in a more intuitive way by selecting different metrics or results directly within their reports. Learn how to build a dynamic table that changes based on user input, showcasing metrics like actuals, previous year comparisons, and percentage to revenue, all within a single formula-driven structure.

- Learn how to create custom tables that act as slicers for dynamic visualizations. These tables allow users to switch between different metrics seamlessly.

```
1 % to Revenue =
2 VAR CurrentItem = SELECTEDVALUE( 'Income Statement Template'[Items (Normalized)] )
3
4 RETURN
5 SWITCH( TRUE(),
6     CurrentItem = "Total Revenues", FORMAT( 1, "0.00%" ),
7     CurrentItem = "Total COGS", FORMAT( DIVIDE( [COGS], [Revenues], 0 ), "0.00%" ),
8     CurrentItem = "Total Gross Profit", FORMAT( DIVIDE( [Gross Profit], [Revenues], 0 ), "0.00%" ),
9     CurrentItem = "Total Other Expenses", FORMAT( DIVIDE( [Other Expenses], [Revenues], 0 ), "0.00%" ),
10    CurrentItem = "Total Net Profit", FORMAT( DIVIDE( [Net Profit], [Revenues], 0 ), "0.00%" ),
11    FORMAT( DIVIDE( CALCULATE( [Actuals (,000)] * 1000,
12        FILTER( 'Income Statement Data', 'Income Statement'[Items] = CurrentItem ) ), [Revenues], 0 ), "0.00%" ) )
```

- Understand how to apply **SWITCH/TRUE** logic to dynamically **update** your **tables** and **visuals** based on user selections.
- Discover how to **reuse existing measures** in dynamic calculations, reducing redundancy and improving performance.
- Gain insights into how **SELECTEDVALUE** works to **filter** your visuals dynamically based on user inputs.

Dynamic visualizations in Power BI bring **financial reports** to **life** by allowing users to **interact** with the **data**. By leveraging supporting tables, **SWITCH/TRUE** logic, and **SELECTEDVALUE**, you can create flexible and engaging reports that adapt to user inputs.

The screenshot shows the Power BI DAX editor interface. The top ribbon includes tabs for File, Home, Insert, Modeling, View, Help, Format, Data / Drill, Table tools, and Measure tools. The Name field is set to 'Measure', the Home table is 'Income Analysis', and the Data category is 'Uncategorized'. The Structure pane shows a list of measures, with 'Balance Sheet Analysis'[B/S Values] selected. The DAX editor displays the following formula:

```
1 SWITCH(TRUE(),  
2 [Table Data] = "Actuals", [Selected Year Actuals],  
3 [Table Data] = "vs Last Year", [TY vs PY Actuals],  
4 [Table Data] = "% to Revenue", [% to Revenue],  
5  
6
```

A tooltip for the SWITCH function is visible, stating: "Returns different results depending on the value of an expression." Below the formula, a table is partially visible with columns for 'revenue', 'Selected Year Actuals', and 'Previous Year'. The table contains the following data:

revenue	Selected Year Actuals	Previous Year
	\$11,318.09	\$
	\$4,828.27

Key Revenue Insights

Bringing it together, explore creating a fully dynamic **Revenue Insights Dashboard** in **Power BI**. This dashboard will provide a breakdown of **key revenue figures**, sales performance by various dimensions, and insightful **visualizations** such as **waterfall charts** and **sales summaries**.

Learn how quickly and efficiently you can **generate actionable insights** by leveraging your existing **DAX measures** and **data models**.

- Use your **pre-built DAX formulas** such as Total Sales, Total Profit, and Profit Margins to **populate** your **report pages** with **key metrics** and learn how to create and **configure slicers** for date, territory, and channel, allowing users to drill into specific data points.

PRO TIPS

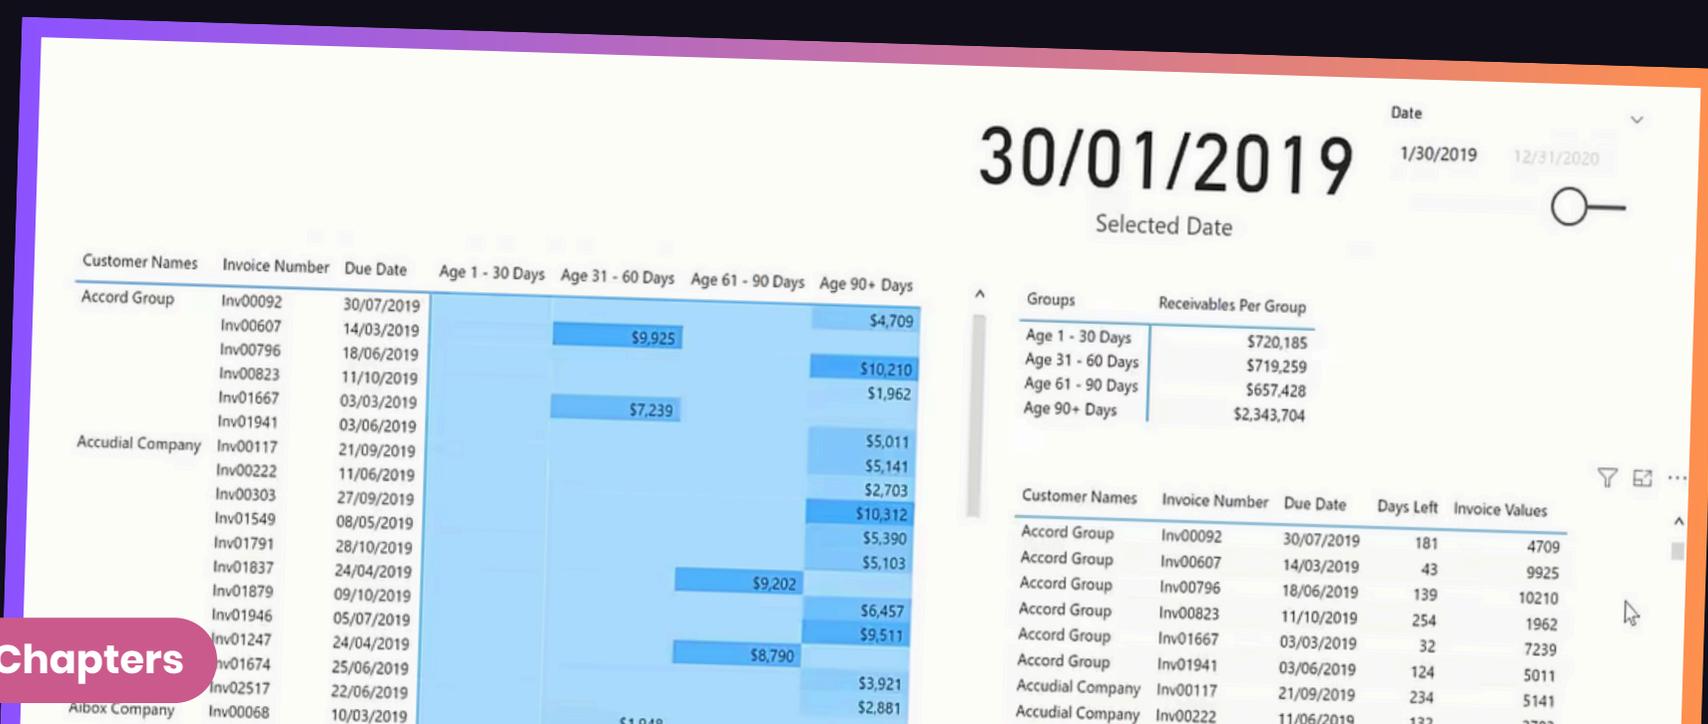

- Make sure all **visuals** on the **page** are **filtered** by the **same Date Slicer, Territory, and Channel slicers** to ensure consistency across your report.
- **Waterfall charts** are perfect for **visualizing** how **revenue** or **profit** has changed over time. They show the incremental changes in values clearly and effectively.
- Use dynamic **DAX measures**, such as **This Year vs. Last Year** or **Percentage to Revenue**, to add more depth to your insights.
- Apply **conditional formatting** to your **tables** and **charts** to highlight key insights, such as high-performing customers or months with negative profit margins.
- **Waterfall charts** are an excellent way to visualize how **values increase** or **decrease over time**, and they are much easier to create in Power BI compared to Excel.

21

Visualization Tips

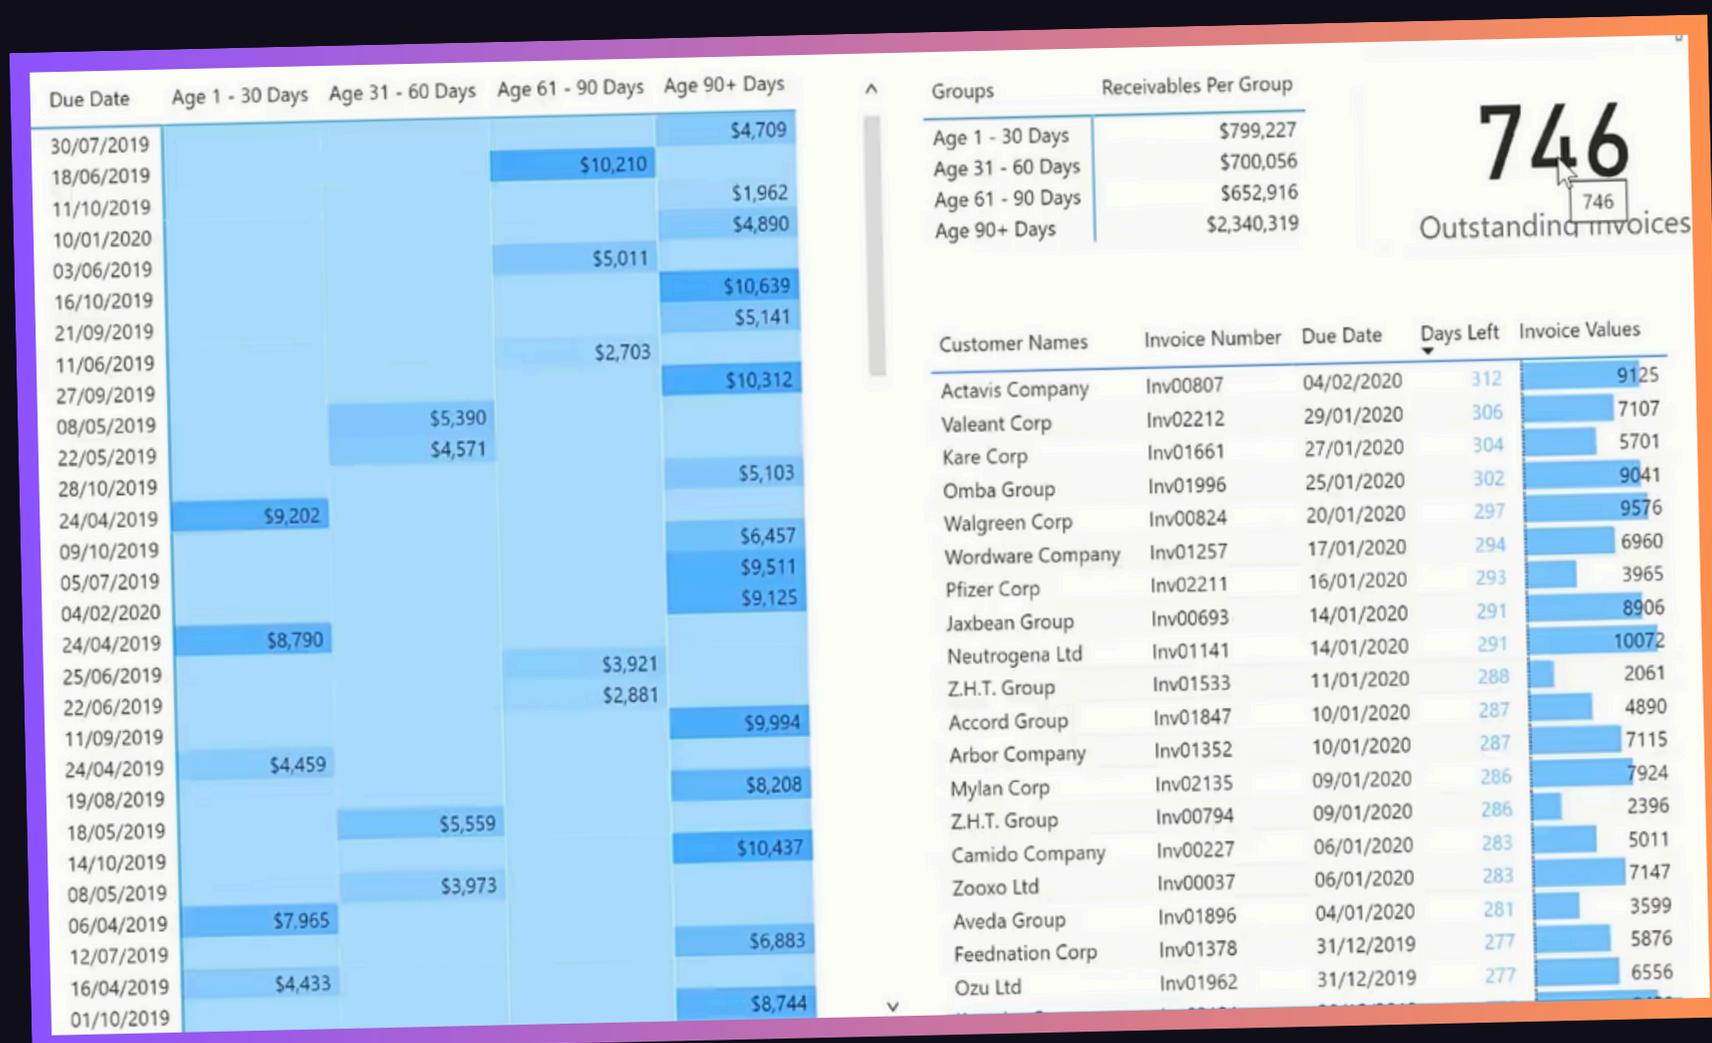

Explore how to make your **Power BI** reports more visually **appealing** and **user-friendly** by applying various **formatting techniques**, improving **readability**, highlighting **key insights**, and ensuring your reports look professional and polished.

- Titles should clearly **indicate** what the **report** or visual represents. Use **text boxes** to **add context** or instructions for users.
- Use **icons** or **logos** to improve the **aesthetic** of your **report**. Ensure logos are placed in a clean, unobtrusive way that doesn't distract from the content.
- Change **slicer styles** (e.g., dropdowns, sliders) to fit your **report layout**. Adjust **slicer colors** and formatting to match your report's theme.

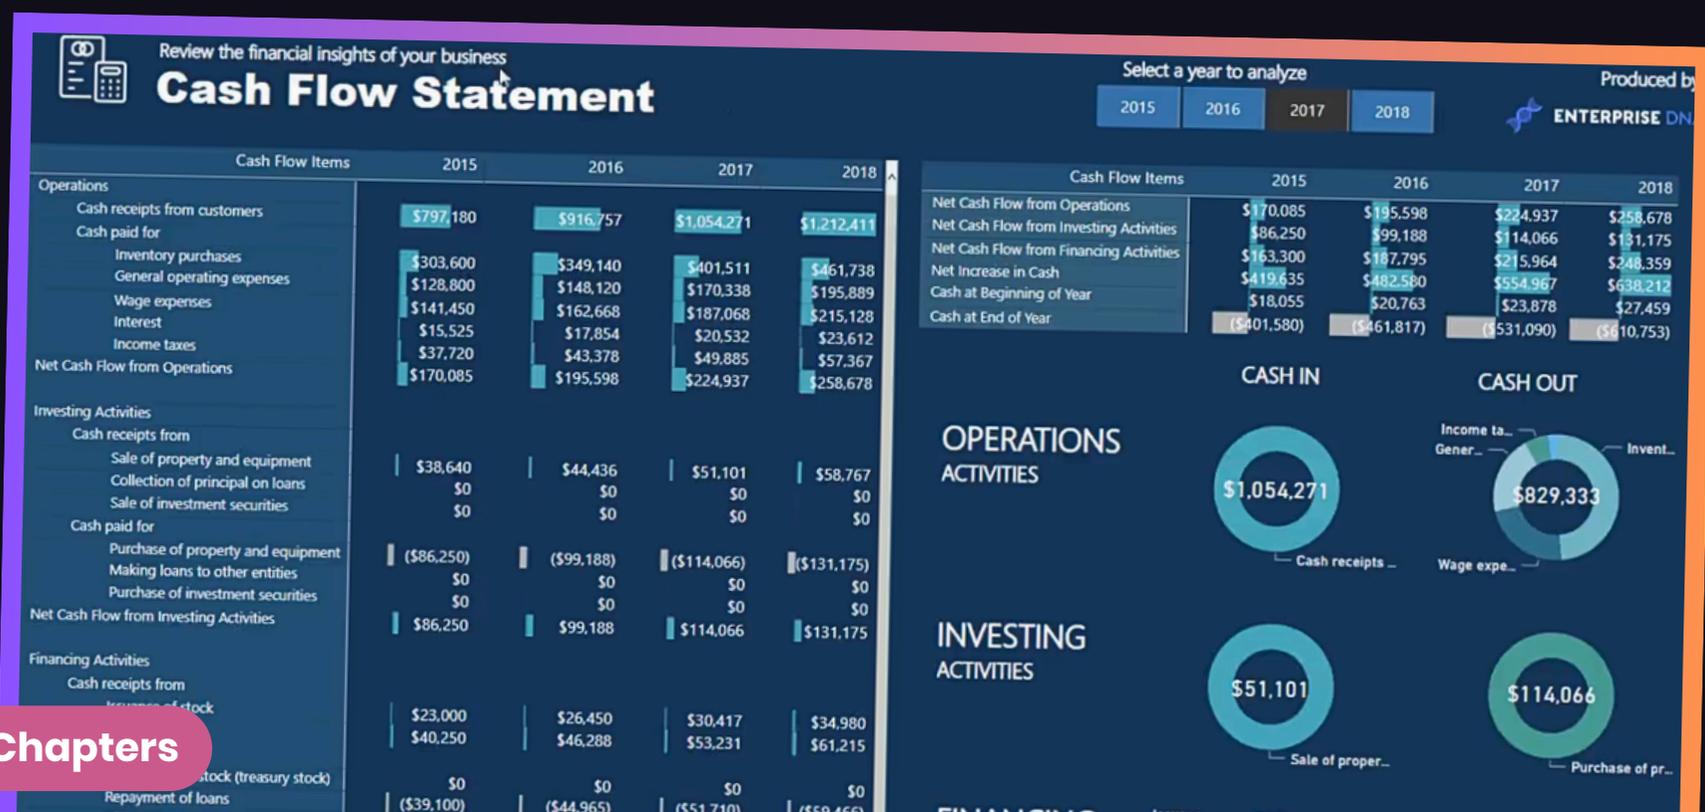

Learn how to set up a **colour palette**, apply **conditional formatting**, adjust table and chart settings, and create visually **appealing layouts**.

- Learn how to create a custom **JSON-based colour palette** and apply it as a **theme** in **Power BI** and understand the importance of a consistent colour scheme to maintain a professional report look.
- Discover why **darker backgrounds** help **visuals stand out** and apply background colours that improve readability and make data pop.
- Use **conditional formatting** to highlight **key metrics** and add data bars for quick, visual representation of values within tables.

Interactive **report navigation** can transform your **Power BI** report into a user-friendly, app-like experience. By using **unique icons** and **bookmarks**, you can make it **easier** for users to **move** between different **report pages**, adding a layer of professionalism and enhancing user engagement.

- Learn how to create **bookmarks** for specific **report pages** and states, including **filters** and use **bookmarks** to control the view users see when navigating through your report.
- Use **unique icons** to create **interactive buttons** for users to **click** and **navigate** between pages and customize actions on icons to link them to specific bookmarks.
- Add **tooltips** to icons to guide users on what each button does and ensure users can easily understand the **purpose** of each **navigation element**.

Back to Chapters

PRO TIPS

- A well-thought-out **color palette** improves the **readability** and **professionalism** of your report. Avoid random colors that clash with your theme.
- Keep your report layout **clean** and **avoid overcrowding** with **too many visuals**. Focus on the most important insights.
- Experiment with **different chart types** (e.g., bar charts, waterfall charts) to see which best represents your data.
- Use **subtle background colors** or **shapes** to group **related visuals** and make your report visually appealing.
- Apply your **theme** consistently across all **visuals** to maintain a **polished look** and avoid random colour choices that can distract users.
- Keep the **report page clean** and **avoid overcrowding visuals** and use whitespace effectively to make key insights stand out.

Data Analysis in R for Statistics

Introduction

R is a powerful language for statistical analysis and data visualization. This guide provides insights into key statistical methods, packages, and best practices for data analysis using R.

Key Statistical Concepts

- Descriptive Statistics**
 - Measures of central tendency (mean, median, mode)
 - Measures of variability (variance, standard deviation, interquartile range)
- Inferential Statistics**
 - Hypothesis testing (t-tests, chi-squared tests)
 - Confidence intervals
 - p-values and significance levels
- Regression Analysis**
